GROUP 9.	Habitat Assessments (Streams)	77
GROUP 10.	Dissolved Oxygen (DO).....	77

Introduction

In accordance with Section 303(d) of the federal Clean Water Act, States must prepare a list of impaired waters that require a Total Maximum Daily Load study every 2 years (i.e., the 303(d) List). In parallel each State produces a 305(b) report which includes impaired waters that do not require a TMDL because either; a TMDL has been completed (aka category 4A waters), other enforceable pollution control measure are expected to restore water quality (aka category 4B waters), or the impairment is due to a non-pollutant such as exotic weeds (aka category 4C waters). This document provides a list of all surface waters that were removed from the 4A, 4B, and 4C impairment categories (i.e., “deimpaired”) and the reasons why they were removed.

Assessment outcomes cover a spectrum from very good to very bad coded as an alpha numeric scale that provides additional distinctions in cases where and impairment exists. In each of the deimpairments detailed within this document the 2012 and 2014 assessment status is highlighted applying the categories in the table below.

	Severe	Poor	Likely Bad	No Data	Likely Good	Marginal	Good
	Not Supporting, Severe	Not Supporting, Marginal	Insufficient Information – Potentially Not Supporting	No Data	Insufficient Information – Potentially Full Supporting	Full Support, Marginal	Full Support, Good
CATEGORY	Description						
*Category 2	Meets standards					2-M or 2-OBS	2-G
Category 3	Insufficient Information		3-PNS	3-ND	3-PAS		
Category 4	Does not Meet Standards;						
4A	TMDL Completed	4A-P	4A-M or 4A-T				
4B	Other enforceable measure will correct the issue.	4B-P	4B-M or 4B-T				
4C	Non-pollutant (i.e. exotic weeds)	4C-P	4C-M				
Category 5	TMDL Needed	5-P	5-M or 5-T				

GROUP 1. WWTFs currently in "significant non-compliance" - Ammonia

Ammonia can have a wide range of impacts to aquatic life, plants, and humans. The chronic and acute criteria for ammonia in freshwater resides in Env-Wq 1703.25 and Env-Wq 1703.26 through 31 for salt waters with a range of salinities.

Assessment Category 4B is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because other pollution control requirements are reasonably expected to result in attainment of the water quality standard in the near future.

One form of Category 4B is triggered when a wastewater treatment facility (WWTF) is currently in "significant non-compliance" of its NPDES permit (as defined by EPA), or is on the "exceptions list" (i.e. facilities that are in significant non-compliance for two or more quarters), for one or more of its permitted water quality based pollutant effluent limits. Water quality based effluent limits are limits based on modeling or dilution calculations to meet water quality standards.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHEST600031004-03-03	TIDE MILL CREEK	Ammonia (Un-ionized)-	Hampton	4B-T	3-PAS

Tide Mill Creek (NHEST600031004-03-03) was listed as impaired in 2012 based on NPDES permit violations at the Hampton WWTF. The facility was in "significant non-compliance" with its NPDES permit for exceeding its ammonia-nitrogen monthly average concentration limits in excess of 40 percent. The Hampton WWTF attributed its violations to heavy rains that caused solids carryover. Hampton entered into an AOC with NHDES (NHDES AOC 11-006 WD) on March 1, 2011 to address its solids handling issues. As of March 2014 the Hampton WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its ammonia-nitrogen monthly average concentration limits.

The 4B impairment of Tide Mill Creek (NHEST600031004-03-03) for Aquatic Life Use due to excess Ammonia (Un-ionized) has been removed. The Hampton WWTF is no longer in significant non-compliance, and Tide Mill Creek has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV600030603-01	COCHECO RIVER	Ammonia (Total) - ALUS	Farmington	4B-T	3-PAS

The Cocheco River (NHRIV600030603-01) was listed as impaired in 2012 based on NPDES permit violations at the Farmington WWTF. The facility was in "significant non-compliance" with its NPDES permit for exceeding its ammonia-nitrogen monthly average concentration limits in excess of 40 percent. Farmington WWTF attributed its violations to operational issues, including its annual sludge dewatering process and low dissolved oxygen levels in its oxidation ditches. Farmington WWTF was issued an AO by the EPA on April 30, 2008, specifically AO 08-010, to assess the feasibility of implementing seasonal and year-round land application as an alternative to upgrading its wastewater treatment facility to comply with the effluent limitations in its NPDES permit. Farmington completed its Phase I Rapid Infiltration Basin (RIB) Project and began pumping treated effluent to its RIBs on July 8, 2010. Farmington has not discharged to the Cocheco River since this time. As of March 2014 the Farmington WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its ammonia-nitrogen monthly average concentration limits.

The 4B impairment of the Cocheco River (NHRIV600030603-01) for Aquatic Life Use due to excess Ammonia (Total) has been removed. The Farmington WWTF is no longer in significant non-compliance, and the Cocheco River has been placed in Category 3 (Insufficient Information).

GROUP 2. WWTFs currently in "significant non-compliance" - Biochemical Oxygen Demand (BOD)

Dissolved oxygen is critical to the balanced, integrative, and adaptive community of organisms as described in Env-Wq 1703.19. As such, the water quality standard provide criteria for Class A waters, Class B waters, waters with cold water fish species, and in both thermally stratified and unstratified lakes, impoundments, and reservoirs in Env-Wq 1703.07 (a), (b), (c), and (d). Wastewater treatment facility (WWTF) discharge permits from EPA include a biochemical oxygen demand (BOD) such that during the periods of highest stress on the aquatic organism, when the temperature is high and the natural reaeration is low, the WWTF does not drive the dissolved oxygen in the system to unhealthy low levels.

Assessment Category 4B is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because other pollution control requirements are reasonably expected to result in attainment of the water quality standard in the near future.

One form of Category 4B is triggered when a wastewater treatment facility (WWTF) is currently in "significant non-compliance" of its NPDES permit (as defined by EPA), or is on the "exceptions list" (i.e. facilities that are in significant non-compliance for two or more quarters), for one or more of its permitted water quality based pollutant effluent limits. Water quality based effluent limits are limits based on modeling or dilution calculations to meet water quality standards.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700030104-18	CONTOOCCOOK RIVER - US OF PETERBOROUGH WWTF TO BOGLIE BK	BOD, Biochemical oxygen demand	Peterborough	4B-T	3-PAS

The Contoocook River, starting several hundred feet upstream of the Peterborough WWTF and continuing to Boglie Brook (NHRIV700030104-18) was listed as impaired in 2012 based on NPDES permit violations at the Peterborough WWTF. The Peterborough WWTF was in violation of its NPDES permit from January thru May of 2009 and from January thru March of 2010, for effluent BOD monthly average concentration limit violations; and from January thru April of 2010 for effluent BOD monthly average loading limit violations. The facility was in "significant non-compliance" with its NPDES permit for exceeding its effluent BOD monthly average concentration and load limits in excess of 40 percent. The BOD violations in 2009 were attributed to low lagoon levels combined with colder temperatures decreasing biological activity. The BOD violations in 2010 were attributed to decreased biological activity due to colder temperatures, and nitrification occurring. As of Mach 2014 the Peterborough WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration and load limits.

The 4B impairment of the Contoocook River (NHRIV700030104-18) for Aquatic Life Use due to excess BOD, Biochemical oxygen Demand has been removed. The Peterborough WWTF is no longer in significant non-compliance, and the Contoocook River has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700060802-14-02	MERRIMACK RIVER	BOD, Biochemical oxygen demand	Hooksett	4B-T	3-PAS

The Merrimack River (NHRIV700060802-14-02) was listed as impaired in 2012 based on NPDES permit violations at the Hookset WWTF. The Hookset WWTF was in violation of its NPDES permit from June thru October of 2010 for effluent BOD monthly average concentration limit violations. The facility was in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration limits in excess of 40 percent. The Hookset WWTF was having laboratory issues, specifically with Dissolved Oxygen (DO) depletion in the BOD analysis. NHDES offered technical assistance to address this issue. As of Mach 2014 the Hookset WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration and load limits.

The 4B impairment of the Merrimack River (NHRIV700060802-14-02) for Aquatic Life Use due to excess BOD, Biochemical oxygen Demand has been removed. The Hookset WWTF is no longer in significant non-compliance, and the Merrimack River has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV801030102-08	JOHNS RIVER	BOD, Biochemical oxygen demand	Dalton	4B-T	3-PAS

The Johns River (NHRIV801030102-08) was listed as impaired in 2008 based on NPDES permit violations at the Whitefield WWTF. EPA issued Whitefield an AO on January 16, 2009 to address its NPDES permit violations. Continuing into the 2012 assessment cycle the Whitefield WWTF was in violation of its NPDES permit in October and December of 2010 and January, February, and April of 2011 for effluent BOD monthly average concentration limit violations. The facility was in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration limits for four months during two consecutive quarter review periods. The Whitefield WWTF attributed its BOD violations to colder temperatures which resulted in lower biological activity in its lagoons. As of Mach 2014 the Whitefield WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration and load limits.

The 4B impairment of the Johns River (NHRIV801030102-08) for Aquatic Life Use due to excess BOD, Biochemical oxygen Demand has been removed. The Whitefield WWTF is no longer in significant non-compliance, and the Whitefield River has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV802010403-20	ASHUELOT RIVER - 300FT US OF HINSDALE WWTF TO CONNECTICUT R	BOD, Biochemical oxygen demand	Hinsdale	4B-T	3-PAS

The Ashuelot River starting 300 feet upstream of the Hinsdale WWTF and continuing to the Connecticut River (NHRIV802010403-20) was listed as impaired in 2012 based on NPDES permit violations at the Hinsdale WWTF. The Hinsdale WWTF was in violation of its NPDES permit in March thru April of 2011 for effluent BOD monthly average concentration limit violations, and in February thru May of 2011 for effluent BOD monthly average load limit violations. The facility was in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration limits in excess of 40 percent and for exceeding its BOD monthly average load limits for four months during two consecutive quarter review periods. NHDES offered technical assistance to address this issue. As of Mach 2014 the Hinsdale WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its BOD monthly average concentration and load limits.

The 4B impairment of the Ashuelot River (NHRIV802010403-20) for Aquatic Life Use due to excess BOD, Biochemical oxygen Demand has been removed. The Hinsdale WWTF is no longer in significant non-compliance, and the Ashuelot River has been placed in Category 3 (Insufficient Information).

GROUP 3. WWTFs currently in "significant non-compliance" - Iron

When Iron rich waters mix with healthy oxygen rich waters, ferric hydroxide (Fe(OH)₃) floc can form on coat the gills of some fish impairing their ability to breath. Precipitates of iron can then settle smothering benthic invertebrates, plants, and fish eggs. In severe cases, precipitates may consolidate thereby creating impenetrable hard bottoms.

Assessment Category 4B is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because other pollution control requirements are reasonably expected to result in attainment of the water quality standard in the near future.

One form of Category 4B is triggered when a wastewater treatment facility (WWTF) is currently in "significant non-compliance" of its NPDES permit (as defined by EPA), or is on the "exceptions list" (i.e. facilities that are in significant non-compliance for two or more quarters), for one or more of its permitted water quality based pollutant effluent limits. Water quality based effluent limits are limits based on modeling or dilution calculations to meet water quality standards.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV801030403-07	AMMONOOSUC RIVER	Iron-ALUS	Bethlehem	4B-T	3-PAS

Ammonoosuc River (NHRIV801030403-07) was listed as impaired in 2012 based on NPDES permit violations in April, July and October 2010 for effluent iron daily maximum concentration limit violations at the GDF Suez Energy Generation (Bethlehem Power Plant). The facility was in "significant non-compliance" with its NPDES permit for exceeding its iron daily maximum concentration limits in excess of 40 percent. Suez Energy attributed its iron violations to groundwater infiltration in its stormwater system having naturally occurring high levels of iron. Suez Energy removed its stormwater from its collection system, and has since maintained compliance with its iron limits. As of Mach 2014 Suez Energy was no longer in "significant non-compliance" with its NPDES permit for exceeding its iron daily maximum concentration limits.

The 4B impairment of the Ammonoosuc River (NHRIV801030403-07) for Aquatic Life Use due to excess Iron has been removed. The GDF Suez Energy Generation (Bethlehem Power Plant) is no longer in significant non-compliance, and the Ammonoosuc River has been placed in Category 3 (Insufficient Information).

GROUP 4. WWTFs currently in "significant non-compliance" - Total Suspended Solids (TSS)

The concentration of total dissolved solids are made up of calcium, chlorides, nitrate, phosphorus, iron, sulfur, and other ions particles and affect the water balance in the cells of

aquatic organisms. Total solids also affect water clarity. Higher solids decrease the passage of light through water, thereby slowing photosynthesis by aquatic plants. Water will heat up more rapidly and hold more heat; this, in turn, might adversely affect aquatic life that has adapted to a lower temperature regime and/or reduce the amount of oxygen available in the water for aquatic organisms.

Assessment Category 4B is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because other pollution control requirements are reasonably expected to result in attainment of the water quality standard in the near future.

One form of Category 4B is triggered when a wastewater treatment facility (WWTF) is currently in "significant non-compliance" of its NPDES permit (as defined by EPA), or is on the "exceptions list" (i.e. facilities that are in significant non-compliance for two or more quarters), for one or more of its permitted water quality based pollutant effluent limits. Water quality based effluent limits are limits based on modeling or dilution calculations to meet water quality standards.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHEST600031003-02	TAYLOR RIVER	Total Suspended Solids (TSS)	Hampton	4B-T	3-PAS

The Taylor River (NHEST600031003-02) was listed as impaired in 2012 based on NPDES permit violations in February and May thru July of 2011 for effluent TSS daily maximum concentration limit violations at Aquatic Research Organisms. The facility was in "significant non-compliance" with its NPDES permit for exceeding its TSS daily maximum concentration limits in excess of 40 percent. Aquatic Research Organisms was unable to attribute its violations to a specific cause. As of Mach 2014 Aquatic Research Organisms was no longer in "significant non-compliance" with its NPDES permit for exceeding its TSS daily maximum concentration limits.

The 4B impairment of the Taylor River (NHEST600031003-02) for Aquatic Life Use due to excess TSS has been removed. Aquatic Research Organisms is no longer in significant non-compliance, and the Taylor River has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV801030403-03	AMMONOOSUC RIVER	Total Suspended Solids (TSS)	Bethlehem	4B-T	3-PAS

The Ammonoosuc River (NHRIV801030403-03) was listed as impaired in 2012 based on NPDES permit violations in April and July thru September 2010 for effluent TSS monthly average concentration limit violations at Bethlehem Village District. The facility was in "significant non-compliance" with its NPDES permit for exceeding its effluent TSS monthly average concentration limits for four months during two consecutive quarter review periods. Bethlehem Village District attributed its violations to algae blooms within its lagoons. As of Mach 2014 Bethlehem Village District was no longer in "significant non-compliance" with its NPDES permit for exceeding its TSS monthly average concentration limits.

The 4B impairment of the Ammonoosuc River (NHRIV801030403-03) for Aquatic Life Use due to excess TSS has been removed. Bethlehem Village District is no longer in significant non-compliance, and the Ammonoosuc River has been placed in Category 3 (Insufficient Information).

GROUP 5. WWTFs currently in "significant non-compliance" - Phosphorus (Total)

While essential to plants and animals, phosphorus is the limiting nutrient in freshwater systems. The stress induced by too much phosphorus can lead to a series of detrimental responses from excess plant growth, to algae blooms, to decreased dissolved oxygen, and the loss of benthic macroinvertebrates and fish species.

Assessment Category 4B is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because other pollution control requirements are reasonably expected to result in attainment of the water quality standard in the near future.

One form of Category 4B is triggered when a wastewater treatment facility (WWTF) is currently in "significant non-compliance" of its NPDES permit (as defined by EPA), or is on the "exceptions list" (i.e. facilities that are in significant non-compliance for two or more quarters), for one or more of its permitted water quality based pollutant effluent limits. Water quality based effluent limits are limits based on modeling or dilution calculations to meet water quality standards.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHIMP600030406-03	SALMON FALLS RIVER - ROLLINSFORD DAM	Phosphorus (Total)	Rollinsford	4B-T	3-PAS

The Salmon Falls River - Rollinsford Dam (NHIMP600030406-03) was listed as impaired in 2012 based on NPDES permit violations in July thru September 2010 for effluent phosphorous monthly average concentration limit violations at the Somersworth WPCF. The facility was in "significant non-compliance" with its NPDES permit for exceeding its phosphorous monthly average concentration limits in excess of 40 percent. Somersworth WPCF attributed its violations to a combination of very low flows, higher than average influent BOD loadings, and restricted internal flow rates. NHDES offered technical assistance to address Somersworth's issues. As of March 2014 Somersworth WPCF was no longer in "significant non-compliance" with its NPDES permit for exceeding its phosphorous monthly average concentration limits.

The 4B impairment of the Salmon Falls River - Rollinsford Dam (NHIMP600030406-03) for Aquatic Life Use due to excess total phosphorus has been removed. Somersworth WPCF is no longer in significant non-compliance, and the Salmon Falls River - Rollinsford Dam has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700030104-18	CONTOOCOOK RIVER - US OF PETERBOROUGH WWTF TO BOGLIE BK	Phosphorus (Total)	Peterborough	4B-T	3-PAS

The Contoocook River - Upstream of Peterborough WWTF to Boglie Bk (NHRIV700030104-18) was listed as impaired in 2008 based on NPDES permit violations from July thru December 2007 for effluent phosphorous monthly average concentration limit violations at the Peterborough WWTF. The facility was in "significant non-compliance" with its NPDES permit for exceeding its phosphorous monthly average concentration limits in excess of 40 percent. Effective May 1, 2007, Peterborough WWTF was issued a new NPDES permit establishing a more stringent discharge limit for effluent phosphorous concentration. The Peterborough WWTF was in violation of its NPDES permit from October 2008 thru March 2009 for effluent phosphorous monthly average concentration limit violations. The facility was in "significant non-compliance" with its NPDES permit for exceeding its effluent phosphorous monthly average concentration limits in excess of 40 percent. Peterborough WWTF was issued an

Administrative Order by Consent (AOC) by the NHDES on March 10, 2009 (AO 09-002 WD effective date March 19, 2009). The AO established interim effluent limits for total phosphorous, including 6.0 mg/L for average monthly limit. Peterborough violated its interim limit for total phosphorous in February 2010 and in January and February 2011. As of March 2014 the Peterborough WWTF was no longer in "significant non-compliance" with its NPDES permit for exceeding its phosphorous monthly average concentration limits.

The 4B impairment of the Contoocook River - UU Of Peterborough WWTF to Boglie Bk (NHRIV700030104-18) for Aquatic Life Use due to excess total phosphorus has been removed. The Peterborough WWTF is no longer in significant non-compliance, and the Contoocook River - US of Peterborough WWTF to Boglie Bk has been placed in Category 3 (Insufficient Information).

GROUP 6. Chlorophyll-a – Swimming Use Support (i.e. Primary Contact Recreation)

Excessive algal growth (high biomass and high chlorophyll-a values) can impair the public safety and aesthetic enjoyment of surface waters. The General Water Quality Criteria (Env-Wq 1703.03) require that surface waters be free of substances which: produce color or turbidity making the water unsuitable for the designated use, or interfere with recreational activities (Env-Wq 1703.03 (c)(1) c & e). For assessment purposes, chlorophyll-a concentrations in excess of 15 µg/L in fresh water and 20 µg/L in salt water are indicators of excessive algal growth that interferes with recreational activities.

Assessment category 4A is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because a TMDL has been completed

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700040402-01	FLINTS POND	Chlorophyll-a - PCR	Hollis	4A-M	2-M

Flints Pond (NHLAK700040402-01) was listed as impaired in 2006 due to elevated chlorophyll-a, particularly two elevated readings of 17.5 µg/L and 16.4 µg/L on 6/3/1997 and 8/20/1995, respectively. During the current assessment period (2003 to 2014), there has been only one sample that exceeded the 15 µg/L threshold. A single sample from 1998 to 2013 collected on 6/22/2011 was 23.7 µg/L. All of the samples collected in 2012 and 2013 were less than 7 µg/L and were collected under similar conditions as the past exceedences. The frequency of apparent high values does not warrant waterbody impairment.

The 4A impairment of Flints Pond (NHLAK700040402-01) for Primary Contact Recreation (i.e. swimming) due to elevated chlorophyll-a has been removed. Flints Pond has been placed in Category 2 (Full Support).

Notes:

CHLA-GRAB-CP = Chlorophyll-a grab samples within the summer critical period.
 “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless Available older data is provided for context. See the 2014 CALM for addition details.

GROUP 7. Bacteria - Enterococcus and Escherichia coli

Elevated bacteria levels in waters present a public health risk to people who have contact with those waters. Acceptable bacteria levels to protect primary contact recreation (i.e. swimming) reside in Env-Wq 1703.06 and RSA 485-A:8, I, II, & V.

Assessment category 4A is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because a TMDL has been completed

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHEST600030903-01-03	BELLAMY RIVER SOUTH CLEMENT POINT	Enterococcus	Dover	4A-P	3-PAS

The Bellamy River South (NHEST600030903-01-02) was added to the 2008 303(d) list due to elevated Enterococcus. NHEST600030903-01-02 was listed as impaired in 2008 based on two grab sample exceedences in 2006 and a single geometric mean exceedence in 2006. Following the 2008 assessment cycle, NHEST600030903-01-02 was split into two separate AUIDs; Bellamy River South Clement Point (NHEST600030903-01-03) and Bellamy River South (NHEST600030903-01-04) due to changes in classifications of the shellfish management area. The 2008 impairment was carried forward to 2010 for both of the new AUIDs following the breakup of NHEST600030903-01-02.

In 2012 the Bellamy River South Clement Point (NHEST600030903-01-03) was included in the New Hampshire Statewide Total Maximum Daily Load (TMDL) for Bacteria Impaired Waters (TMDL ID = 39277) and categorized as 4A-M in the 2012 assessment. All of the data used to make the original impairment determination and subsequent inclusion in the Statewide Bacteria TMDL, was collected at station NH-0052A, which is physically located in the portion of the river now designated as Bellamy River South (NHEST600030903-01-04). After the assessment unit was split, the Bellamy River South Clement Point (NHEST600030903-01-03) should not have been included on the 2010 303(d) for elevated enterococcus because the original high bacteria readings were not collected within the assessment unit. Since the 2008 cycle, only a single sample has been collected at station NCA10-2043, which is

located within the Bellamy River South Clement Point (NHEST600030903-01-03) assessment unit. The sample was collected during dry weather on 8/30/2010, and had an enterococcus concentration of 16 cts/100mL, well below the water quality criteria of 104 cts/100mL, and not enough to make an assessment determination.

The 4A-M impairment of the Bellamy River South Clement Point (NHEST600030903-01-03) for Primary Contact Recreation (i.e. swimming) due to elevated enterococcus has been removed. The Bellamy River South Clement Point has been placed in Category 3-PAS (Insufficient Information, Potentially Attaining Standards).

Notes:

- ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.
- ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
- ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
- ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHEST600030904-04-06	ADAMS POINT SOUTH - COND APP	Enterococcus	Durham	4A-P	2-M

The Adams Point South – Conditionally Approved Area (NHEST600030904-04-06) was listed as impaired in 2008 due

to elevated Enterococcus for both primary and secondary contact recreation. This assessment unit was listed as impaired based on grab sample exceedences in 2006 and 2010. There have been no geometric mean exceedences recorded from 2002 to 2013. During that same time period 1.5% and 0.8% of the samples exceeded the grab sample criteria for enterococcus for primary contact recreation and secondary contact recreation, respectively. Since 2010 the site has been sampled every year without a single grab sample exceedence or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2010, three years and 37 additional grab samples have been collected which have been used to calculate 24 geometric means and no enterococcus exceedences have occurred.

The 4A impairment of the Adams Point South – Conditionally Approved Area (NHST600030904-04-06) for both Primary Contact Recreation (i.e. swimming) and Secondary Contact Recreation due to elevated enterococcus has been removed. The Adams Point South – Conditionally Approved area has been placed in Category 2 (Fully Supporting).

Notes:

ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.

2012 305(b) Category 4A, 4B, and 4C Impairments Not Included in the 2014 305(b) Report

ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
 ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
 ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.
 "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHEST600030904-06-12	U LITTLE BAY (SOUTH)	Enterococcus	Durham	4A-P	2-M

Upper Little Bay South (NHEST600030904-06-12) was listed as impaired in 2008 due to elevated Enterococcus for both primary and secondary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 2005, 2006, and 2010 and a single geometric mean exceedence in 2010. While the 2006 exceedence appears severe, it occurred after a three day rainfall of 9.2 inches associated with the 2006 Mothers Day Flood. Over the period of 2000 through 2013, 2.6% of samples (n=157) exceeded the grab sample criteria for enterococcus. Since 2010 the site has been sampled every year without a single grab sample exceedence or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding

precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2010, three years and 42 additional grab samples have been collected which have been used to calculate 28 geometric means and no enterococcus exceedences have occurred.

The 4A impairment of Upper Little Bay South (NHEST600030904-06-12) for both Primary Contact Recreation (i.e. swimming) and Secondary Contact Recreation due to elevated enterococcus has been removed. Upper Little Bay South has been placed in Category 2 (Fully Supporting).

Notes:

- ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.
- ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
- ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
- ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHEST600031002-02	LITTLE HARBOR	Enterococcus	Rye	4A-M	2-G

Little Harbor (NHEST600031002-02) was listed as impaired in 2004 due to elevated Enterococcus for primary contact recreation. This assessment unit was listed as impaired based on grab sample exceedences in 2001, 2002, and 2006 and a geometric mean exceedence in 2006. During that time period 5.4% of samples exceeded the grab sample criteria for enterococcus. Since 2006 the site has been sampled every year without a single grab sample or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2006, seven years and 24 additional grab samples have been collected which have been used to calculate 10 geometric means and no enterococcus exceedences have occurred. It should be noted that in the 2010 assessment cycle station BCH26A, which had enterococcus greater than 5,000 cts/100mL, was mistakenly associated with Little Harbor (NHEST600031002-02).

The 4A impairment of Little Harbor (NHEST600031002-02) for Primary Contact Recreation (i.e. swimming) due to elevated enterococcus has been removed. Little Harbor has been placed in Category 2 (Fully Supporting).

Notes:

ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.

2012 305(b) Category 4A, 4B, and 4C Impairments Not Included in the 2014 305(b) Report

ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
 ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
 ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.
 "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHOCN000000000-02-06	ATLANTIC OCEAN - SAWYER BEACH	Enterococcus	Rye	4A-P	2-G

The Atlantic Ocean – Sawyer Beach (NHOCN000000000-02-06) was listed as impaired in 2004 due to elevated Enterococcus for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 2004, 2006, and 2007. During that time period 1.0% of samples exceeded the grab sample criteria for enterococcus. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2007 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2007, six years and 631 additional grab samples have been collected which have been used to calculate 61 geometric means and no enterococcus exceedences have occurred.

The 4A impairment of the Atlantic Ocean – Sawyer Beach (NHOCN000000000-02-06) for Primary Contact Recreation (i.e. swimming) due to elevated enterococcus has been removed. The Atlantic Ocean – Sawyer Beach has been placed in Category 2 (Fully Supporting).

Notes:

ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.
 ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
 ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
 ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.
 "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHOCN000000000-02-10	ATLANTIC OCEAN - HAMPTON BEACH STATE PARK BEACH	Enterococcus	Rye	4A-P	2-M

The Atlantic Ocean – Hampton Beach State Park Beach (NHOCN000000000-02-10) was listed as impaired in 2006 due to elevated Enterococcus for primary contact recreation. The impairment on this assessment unit maintained as impaired based on collection of grab sample exceedences in, 2007, 2009, and 2011. During that time period 0.3% of samples exceeded the grab sample criteria for enterococcus. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2011 the site has been sampled every year

without any grab sample or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2011, two years and 346 additional grab samples have been collected which have been used to calculate 22 geometric means and no enterococcus exceedences have occurred.

The 4A impairment of the Atlantic Ocean – Hampton Beach State Park Beach (NHOCN000000000-02-10) for Primary Contact Recreation (i.e. swimming) due to elevated enterococcus has been removed. The Atlantic Ocean – Hampton Beach State Park Beach has been placed in Category 2 (Fully Supporting).

Notes:

- ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.
- ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
- ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
- ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
----------------------	--------------------	----------------	--------------	------	------

NHOCN00000000-02-11	ATLANTIC OCEAN - SEABROOK TOWN BEACH	Enterococcus	Seabrook	4A-P	2-M
---------------------	---	--------------	----------	------	-----

The Atlantic Ocean - Seabrook Town Beach (NHOCN00000000-02-11) was listed as impaired in 2008 due to elevated Enterococcus for both primary and secondary contact recreation. This assessment unit was listed as impaired for primary contact recreation based on collection of grab sample exceedences in 2001, 2004, 2006, 2007, and 2011. During that time period 0.6% of samples exceeded the grab sample criteria for enterococcus. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2011 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2011, two years and 119 additional grab samples have been collected which have been used to calculate 13 geometric means and no enterococcus exceedences have occurred.

This assessment unit was also listed as impaired for secondary contact recreation on collection of grab sample exceedences in 2006 and 2007. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since the last secondary contact recreation indicator exceedence in 2007 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the freshwater inflow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last secondary contact recreation indicator exceedence in 2007, six years and 479 additional grab samples have been collected which have been used to calculate 47 geometric means and no enterococcus exceedences have occurred.

The 4A impairment of Atlantic Ocean - Seabrook Town Beach (NHOCN00000000-02-11) for both Primary Contact Recreation (i.e. swimming) and Secondary Contact Recreation due to elevated enterococcus has been removed. The Atlantic Ocean - Seabrook Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

- ENTEROCOCCUS-GEO-CP = Enterococcus geometric mean calculated from samples collected during the summer critical period.
- ENTEROCOCCUS-GEO-NCP = Enterococcus geometric mean calculated from samples collected outside the summer critical period.
- ENTEROCOCCUS-GRAB-CP = Enterococcus grab samples collected during the summer critical period.
- ENTEROCOCCUS-GRAB-NCP = Enterococcus grab samples collected outside the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless. Available older data is provided for context. See the 2014 CALM for addition details.

NHIMP700040402-03	NASHUA RIVER - NASHUA CANAL DIKE	Escherichia coli	Nashua	4A-M	2-G

The Nashua River - Nashua Canal Dike (NHIMP700040402-03) was listed as impaired in 2010 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on a pair of historic grab sample exceedences in 2007. No exceedences of the bacteria criteria have been observed since 2007. Sampling from 2010 to 2013 show criteria are being well met under a wide range of weather and flow conditions including the conditions of the high measurements in 2007. Station will continue to be monitored by Nashua River Watershed Association.

The 4A impairment of the Nashua River - Nashua Canal Dike (NHIMP700040402-03) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. The Nashua River - Nashua Canal Dike has been placed in Category 2 (Fully Supporting).

NHLAK600030604-01-02	BOW LAKE - TOWN BEACH	Escherichia coli	Strafford	4A-P	2-M

Bow Lake - Town Beach (NHLAK600030604-01-02) was listed as impaired in 2006 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 1997, 2001, and 2005. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2005 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2005, eight years and 73 additional grab samples have been collected which have been used to calculate nine geometric means and no E. coli exceedences have occurred

The 4A impairment of Bow Lake - Town Beach (NHLAK600030604-01-02) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Bow Lake - Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.

E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.

“Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK600030704-02-03	PAWTUCKAWAY LAKE - TOWN BEACH	Escherichia coli	Nottingham	4A-P	2-G

Pawtuckaway Lake - Town Beach (NHLAK600030704-02-03) was listed as impaired in 2004 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of four grab sample exceedences in 2001, 2002, 2004, and 2009. At no time during that period did the sampling result in a geometric mean criteria exceedence. Since that time the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the grab sample exceedences of 2001, 2002, and 2004 have been repeated. The

lone exceedence in 2009 occurred after a three day rainfall total of 3.9 inches when streamflow at the nearby Oyster River was approximately 20 times normal summer levels. Further, during that 2009 sampling event, the other end of that same beach, a mere 45 feet away had a bacteria count of 14 cts/100mL. While the 3.9 inches in the preceding three days has not reoccurred since 2009, 33 additional samples have been collected with addition rain events captured and no E. coli exceedences.

The 4A impairment of Pawtuckaway Lake - Town Beach (NHLAK600030704-02-03) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Pawtuckaway Lake - Town Beach has been placed in Category 2 (Fully Supporting).

NHLAK700010502-01-02	LITTLE SQUAM LAKE - TOWN BEACH	Escherichia coli	Ashland	4A-P	2-G
----------------------	-----------------------------------	------------------	---------	------	-----

Little Squam Lake - Town Beach (NHLAK700010502-01-02) was listed as impaired in 2004 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 2003 and maintained as impaired based on high values in 2006, and 2008. At no time during that period did the sampling result in a geometric mean criteria exceedence. Since that time the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the grab sample exceedences of 2003 and 2006 have been repeated. The exceedences in 2008 all occurred on August 6 and 8, 2008 after a three day rainfall total of 0.7 to 3.25 inches when streamflow at the nearby Baker River was 10-15 times normal summer levels. While the 3.25 inches in the preceding three days has not reoccurred since 2008, five years and 75 additional samples have been collected with addition rain events captured and no E. coli exceedences.

The 4A impairment of Little Squam Lake - Town Beach (NHLAK700010502-01-02) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Little Squam Lake - Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

Lake Winnepesaukee - Public Dock Town Beach (NHLAK700020110-02-11) was listed as impaired in 2008 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of four grab sample exceedences in 1996, 1998, and 2006. At no time during that period did the sampling result in a geometric mean criteria exceedence. Since 2006 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2006, seven years and 67 additional grab samples have been collected which have been used to calculate eight geometric means and no E. coli exceedences have occurred.

The 4A impairment of Lake Winnepesaukee - Public Dock Town Beach (NHLAK700020110-02-11) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Lake Winnepesaukee - Public Dock Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.

E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.

"Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700020110-02-17	LAKE WINNIPESAUKEE - STATES LANDING TOWN BEACH	Escherichia coli	Moultonborough	4A-P	2-M

Lake Winnepesaukee - States Landing Town Beach (NHLAK700020110-02-17) was listed as impaired in 2008 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 2002, 2005, and 2008. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2008 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the

last exceedence in 2008, five years and 37 additional grab samples have been collected which have been used to calculate six geometric means and no E. coli exceedences have occurred.

The 4A impairment of Lake Winnepesaukee - States Landing Town Beach (NHLAK700020110-02-17) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Lake Winnepesaukee - States Landing Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

- E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.
- E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.
- E.COLI-GRAB-NCP = Escherchia coli grab samples collected outside the summer critical period.
- "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700030101-03-02	CONTOOCCOOK LAKE - TOWN BEACH	Escherichia coli	Jaffrey	4A-P	2-M

Contoocook Lake - Town Beach (NHLAK700030101-03-02) was listed as impaired in 2008 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of minor grab sample exceedences up until 2011 and two higher exceedences, one in 2008 and one in 2009. At no time during that period did the sampling result in a geometric mean criteria exceedence. Since 2011 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2011, two years and 22 additional grab samples have been collected which have been used to calculate three geometric means and no E. coli exceedences have occurred.

The 4A impairment of Contoocook Lake - Town Beach (NHLAK700030101-03-02) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Contoocook Lake - Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

E.COLI-GRAB-CP = Escherichia coli grab samples collected during the summer critical period.

2012 305(b) Category 4A, 4B, and 4C Impairments Not Included in the 2014 305(b) Report

“Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700030107-02-02	NORWAY POND - TOWN BEACH	Escherichia coli	Hancock	4A-P	2-M

Norway Pond - Town Beach (NHLAK700030107-02-02) was listed as impaired in 2004 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences from 2003 and maintained as impaired based on exceedences in 2009 with the exceedences of 2009 triggering a geometric mean exceedence. At no time besides 2009 during that period did the sampling result in a geometric mean criteria exceedence. Since 2009 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2009, four years and 33 additional grab samples have been collected which have been used to calculate six geometric means and no E. coli exceedences have occurred.

The 4A impairment of Norway Pond - Town Beach (NHLAK700030107-02-02) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Norway Pond - Town Beach has been placed in Category 2 (Fully Supporting).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700061403-03-03	COUNTRY POND - LONE TREE SCOUT RESV. BEACH	Escherichia coli	Kingston	4A-M	2-M

Country Pond - Lone Tree Scout Resv. Beach (NHLAK700061403-03-03) was listed as impaired in 2008 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 2000, 2003, and 2007. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2007 the site has been sampled every year without any grab sample exceedences and in 2008 and 2009 there were no geometric mean criteria exceedences. Starting in 2010, the sampling frequency at the beach was reduced such that a 60 day geometric mean calculation is no longer possible. With that said, from 2010 to 2013, the highest reading of the eight samples was a 10

cts/100mL, 9 times lower than the grab sample criteria and 5 times lower than geometric mean criteria. Since 2007, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated.

The 4A impairment of Country Pond - Lone Tree Scout Resv. Beach (NHLAK700061403-03-03) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Country Pond - Lone Tree Scout Resv. Beach has been placed in Category 2 (Fully Supporting).

E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.
 E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.
 "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK801060401-08-02	KOLEMOOK LAKE - TOWN BEACH	Escherichia coli	Springfield	4A-P	2-M

Kolemook Lake - Town Beach (NHLAK801060401-08-02) was listed as impaired in 2004 due to elevated Escherichia coli for primary contact recreation. This assessment unit was listed as impaired and maintained as such based on collection of grab sample exceedences in 2002 and 2006. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2006 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2006, seven years and 51 additional grab samples have been collected which have been used to

calculate 12 geometric means and no E. coli exceedences have occurred.

The 4A impairment of Kolemook Lake - Town Beach (NHLAK801060401-08-02) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Kolemook Lake - Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.

E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.

“Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK801060402-04-02	LITTLE SUNAPEE LAKE - BUCKLIN TOWN BEACH	Escherichia coli	New London	4A-M	2-G

Little Sunapee Lake - Bucklin Town Beach (NHLAK801060402-04-02) was listed as impaired in 2008 due to elevated

Escherichia coli for primary contact recreation. This assessment unit was listed as impaired based on collection of grab sample exceedences in 2006 and 2008. At no time before, during, or after that period did the sampling result in a geometric mean criteria exceedence. Since 2008 the site has been sampled every year without any grab sample or geometric mean criteria exceedences. During that time, both the flow and preceding precipitation conditions experienced during the historic grab sample exceedences have been repeated. Since the last exceedence in 2008, five years and 61 additional grab samples have been collected which have been used to calculate six geometric means and no E. coli exceedences have occurred.

The 4A impairment of Little Sunapee Lake - Bucklin Town Beach (NHLAK801060402-04-02) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Little Sunapee Lake - Bucklin Town Beach has been placed in Category 2 (Fully Supporting).

Notes:

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV600020301-01	EAST BR SACO R - EAST FORK EAST BR SACO R - BLACK BRK - GULF BRK	Escherichia coli	Jackson	4A-M	2-G

East Branch Saco River - East Fork East Branch Saco River - Black Brook - Gulf Brook (NHRIV600020301-01) was listed as impaired in 2006 due to elevated Escherichia coli for primary contact recreation. The original impairment determination in the 2006 cycle was based on station NH_HEX_16.02 which is now known as 12-EBS. 12-EBS and its entire watershed lie within the White Mountain National Forest. There is a gated Forest Service roads that allowed easy access to 12-EBS until hurricane Irene washed it out in 2011. Currently it is 3 miles from the gate to 12-EBS. In 2013, 06-EBS was sampled under similar flow and rain conditions as the 2005, 12-EBS samples. 06-EBS is

six miles downstream of 12-EBS, incorporating runoff from a small collection of cabins. The geometric mean from those 2013 samples was 13 cts/100mL.

The 4A impairment of East Branch Saco River - East Fork East Branch Saco River - Black Brook - Gulf Brook (NHRIV600020301-01) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. East Branch Saco River - East Fork East Branch Saco River - Black Brook - Gulf Brook has been placed in Category 2 (Fully Supporting).

Notes:

- E.COLI-GEO-CP = Escherichia coli geometric mean calculated from samples collected during the summer critical period.
- E.COLI-GRAB-CP = Escherichia coli grab samples collected during the summer critical period.
- E.COLI-GRAB-NCP = Escherichia coli grab samples collected outside the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700020108-01	UNNAMED BROOK - TO WINONA LAKE - NORTH INLET	Escherichia coli	Ashland	4A-P	2-G

The Unnamed Brook - To Winona Lake - North Inlet (NHRIV700020108-01) was listed as impaired in 2008 due to elevated Escherichia coli for primary contact recreation. This is a Class A waterbody, therefore the applicable criteria are more stringent than that for many other waters of the state. Two high reading occurred in 2007 in excess of the single sample criteria leading to an exceedence of the geometric mean criteria. Those samples were collected under low-flow and no rain in the three days prior to sampling. Those sampling conditions were replicated in 2008, 2010, 2011, and 2012 with no reading over 20 cts/100mL.

The 4A impairment of the Unnamed Brook - To Winona Lake - North Inlet (NHRIV700020108-01) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. The Unnamed Brook - To Winona Lake - North Inlet has been placed in Category 2 (Fully Supporting).

Notes:

- E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.
- E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.
- E.COLI-GRAB-NCP = Escherchia coli grab samples collected outside the summer critical period.
- "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700030101-05	TOWNLINE INLET TO CONTOOCCOOK LAKE	Escherichia coli	Jaffrey	4A-P	2-G

Townline Inlet To Contoocook Lake (NHRIV700030101-05) was listed as impaired in 2002 due to elevated

Escherichia coli for primary contact recreation. This waterbody was impaired and maintained as such based on geometric mean exceedences in 2000 and 2005 at station CONJAF6 and a measurement in excess of the single sample maximum criteria in 2006. Since that time there have been seven years of grab samples covering similar weather and flow conditions without a single exceedence. Additional, in four years with geometric mean calculations since the last geometric mean exceedence, there has been sufficient data to calculate a geometric mean and no exceedences have occurred.

The 4A impairment of Townline Inlet To Contoocook Lake (NHRIV700030101-05) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Townline Inlet To Contoocook Lake has been placed in Category 2 (Fully Supporting).

Notes:

- E.COLI-GEO-CP = Escherichia coli geometric mean calculated from samples collected during the summer critical period.
- E.COLI-GEO-nCP = Escherichia coli geometric mean calculated from samples collected outside the summer critical period.
- E.COLI-GRAB-CP = Escherichia coli grab samples collected during the summer critical period.
- E.COLI-GRAB-NCP = Escherichia coli grab samples collected outside the summer critical period.
- "Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700030107-07	MOOSE BROOK - UNNAMED BROOK	Escherichia coli	Hancock	4A-M	2-G

Moose Brook - Unnamed Brook (NHRIV700030107-07) was listed as impaired in 2008 due to elevated Escherichia coli for primary contact recreation. This waterbody appears to have been impaired based on a single high reading in 2006 and should not have been added to the impaired water waterbodies list. Since that high reading, 13 grab samples have been collected covering similar flow and weather conditions of the high value from 2006 with no confirmation exceedence. Additionally, sufficient samples were collected in 2008 to calculate two geometric means which were 25.2 and 32.8 cts/100 mL, well below the 126 cts/100 mL geometric mean criteria.

The 4A impairment of Moose Brook - Unnamed Brook (NHRIV700030107-07) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Moose Brook - Unnamed Brook has been placed in Category 2 (Fully Supporting).

2012 305(b) Category 4A, 4B, and 4C Impairments Not Included in the 2014 305(b) Report

Notes:

- E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.
 - E.COLI-GEO-NCP = Escherchia coli geometric mean calculated from samples collected outside the summer critical period.
 - E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.
 - E.COLI-GRAB-NCP = Escherchia coli grab samples collected outside the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700030204-04	BEARD BROOK - UNNAMED BROOK	Escherichia coli	Washington	4A-M	2-M

Beard Brook - Unnamed Brook (NHRIV700030204-04) was listed as impaired in 2006 due to elevated Escherichia coli for primary contact recreation. Most of the data for this waterbody comes from station ISLWASB including the earlier minor exceedences of the single sample maximum criteria. Since the last single sample exceedence in early 2008, there have been five full years of sampling covering the conditions of the original exceedences without any additional values over the single sample maximum criteria. Back in 2004 there were two slight exceedences of the geometric mean criteria, an E. coli level which has not since been repeated.

The 4A impairment of Beard Brook - Unnamed Brook (NHRIV700030204-04) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Beard Brook - Unnamed Brook has been placed in Category 2 (Fully Supporting).

Notes:

E.COLI-GEO-CP = Escherchia coli geometric mean calculated from samples collected during the summer critical period.

E.COLI-GRAB-CP = Escherchia coli grab samples collected during the summer critical period.

"Current" Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered 'current' unless. Available older data is provided for context. See the 2014 CALM for addition details.

NHRIV700060902-05	SOUHEGAN RIVER - TUCKER BROOK	Escherichia coli	Wilton	4A-P	2-M

Souhegan River - Tucker Brook (NHRIV700060902-05) was listed as impaired in 2006 due to elevated Escherichia coli for primary contact recreation. Grab sample exceedences of 2001 and 2008 at the stations SWA-SOR291 and SWA-SOR296 tended to occur at elevated flows and with preceding rain. Later samples in 2008, plus samples in 2009, 2012, and 2013 at comparable flows and precipitation do not show exceedences of the single sample maximum criteria. Further, there have been 34 geometric means since the geometric mean exceedences in 2001 without any exceedences.

The 4A impairment of Souhegan River - Tucker Brook (NHRIV700060902-05) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Souhegan River - Tucker Brook has been placed in Category 2 (Fully Supporting).

Notes:

- E.COLI-GEO-CP = Escherichia coli geometric mean calculated from samples collected during the summer critical period.
- E.COLI-GEO-NCP = Escherichia coli geometric mean calculated from samples collected outside the summer critical period.
- E.COLI-GRAB-CP = Escherichia coli grab samples collected during the summer critical period.
- E.COLI-GRAB-NCP = Escherichia coli grab samples collected outside the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless. Available older data is provided for context. See the 2014 CALM for addition details.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV801010805-04	BURNSIDE BROOK - UNNAMED BROOK	Escherichia coli	Northumberland	4A-M	2-M

Burnside Brook - Unnamed Brook (NHRIV801010805-04) was listed as impaired in 2008 due to elevated Escherichia

coli for primary contact recreation. All samples have been collected at 03-OTT. Although the upstream watershed is very rural, it is heavily agricultural in the valley bottom. This watershed has the benefits of a very active volunteer monitoring group that have made on the ground efforts to talk with the farmers and help make improvements. There have been ample samples collected in 2001, 2011, 2012, and 2013 to illustrate that water quality criteria are being met at both low and high flow conditions with both little rain and storms in the three days prior to sampling. Although the more recent data does not cover the time when the indicator stream gage reached 10 cfs, that flow has only been exceeded four percent of the time since 1990 and even more rarely (2.5 percent of the time) during the summer season when dairy cattle are likely to be out in the pastures.

The 4A impairment of Burnside Brook - Unnamed Brook (NHRIV801010805-04) for Primary Contact Recreation (i.e. swimming) due to elevated Escherichia coli has been removed. Burnside Brook - Unnamed Brook has been placed in Category 2 (Fully Supporting).

Notes:

- E. COLI-GEO-CP = Escherichia coli geometric mean calculated from samples collected during the summer critical period.
- E. COLI-GRAB-CP = Escherichia coli grab samples collected during the summer critical period.
- “Current” Line for 2014 – Per the methodology outlined in the CALM, all data from this referenced data is considered ‘current’ unless Available older data is provided for context. See the 2014 CALM for addition details.

GROUP 8. Non-Native Aquatic Plants

Exotic macrophytes are non-native, fast growing aquatic plants, which can quickly dominate and choke out native aquatic plant growth in the surface water. Examples of exotic macrophytes include variable milfoil (*Myriophyllum heterophyllum*), Eurasian milfoil (*Myriophyllum spicatum*), fanwort (*Cabomba caroliniana*) and water chestnut (*Trapa natans*). Such infestations are in violation of Env-Wq 1703.19, which states that surface waters shall support and maintain a balanced, integrated and adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of similar natural habitats of a region.

Assessment Category 4C is represents cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because the impairment is not caused by a pollutant.

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700060402-10-01	LOWER SUNCOOK POND	Non-Native Aquatic Plants	Barnstead	4C-M	3-PNS

Lower Suncook Pond (NHLAK700060402-10-01) was listed as impaired in 2006 for non-native aquatic plants for the aquatic life designated use. Infestation by Variable milfoil is currently at a low density/coverage. As of April 2014 control actions include; Herbicide treatment and hand removal and suction harvesting. Reduced growth observed to a level that this in no longer considered and infestation.

The 4C impairment of Lower Suncook Pond (NHLAK700060402-10-01) for the aquatic life designated use due to non-native aquatic plants has been removed. Lower Suncook Pond has been placed in Category 3 (Insufficient Information).

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHLAK700060502-08-02	NORTHWOOD LAKE - TOWN BEACH	Non-Native Aquatic Plants	Northwood	4C-M	3-PNS

Northwood Lake - Town Beach (NHLAK700060502-08-02) was listed as impaired in 2006 for non-native aquatic plants for the aquatic life designated use. Infestation by Variable milfoil is a possible issue however, as of April 2014 ongoing treatment has maintained the variable milfoil outside of the beach area.

The 4C impairment of Northwood Lake - Town Beach (NHLAK700060502-08-02) for the aquatic life designated use due to non-native aquatic plants has been removed. Northwood Lake - Town Beach has been placed in Category 3 (Insufficient Information).

NHLAK802010401-01-02	FOREST LAKE - TOWN BEACH	Non-Native Aquatic Plants	Winchester	4C-M	3-PNS

Forest Lake - Town Beach (NHLAK802010401-01-02) was listed as impaired in 2006 for non-native aquatic plants for the aquatic life designated use. Infestation by Variable milfoil is a possible issue however, as of April 2014 ongoing treatment has maintained the variable milfoil outside of the beach area.

The 4C impairment of Forest Lake - Town Beach (NHLAK802010401-01-02) for the aquatic life designated use due to non-native aquatic plants has been removed. Forest Lake - Town Beach has been placed in Category 3 (Insufficient Information).

GROUP 9. Habitat Assessments (Streams)

The maintenance of a balanced, integrated, and adaptive community described in Env-Wq 1703.19 will be limited if the suitable habitat for that natural community has been severely degraded. The requirement to restore surface waters for designated uses and maintain the physical integrity of surface waters is described in Env-Wq 1703.01(b) and Env-Wq 1703.03(c).

Assessment Category 4C is represents cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because the impairment is not caused by a pollutant,

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV700060201-04	ACADEMY BROOK - LOON POND BROOK	Habitat Assessment (Streams)	Gilmanton	4C-M	3-ND

Academy Brook - Loon Pond Brook (NHRIV700060201-04) was listed as impaired in 2006 for habitat assessment (streams) for the aquatic life designated use. The two stations used to impair Academy Brook - Loon Pond Brook (NHRIV700060201-04) were associated to the wrong AUID. Station SP04M-102 should have been associated to AUID NHRIV700060201-09 which is already associated with samples at SP04M-100 and SP04M-101. Station SP04M-104 should have been associated to AUID NHRIV700060201-10 which is already listed as impaired based on other samples at SP04M-103, SP04M-104, and SP04M-105.

The 4C impairment of Academy Brook - Loon Pond Brook (NHRIV700060201-04) for the aquatic life designated use due to habitat assessment (streams) has been removed. Academy Brook - Loon Pond Brook has been placed in Category 3 (No Data).

GROUP 10. Dissolved Oxygen (DO)

Dissolved oxygen is critical to the balanced, integrative, and adaptive community of organisms as described in Env-Wq 1703.19. As such, the water quality standard provide criteria for Class A waters, Class B waters, waters with cold water fish species, and in both thermally stratified and unstratified lakes, impoundments, and reservoirs in Env-Wq 1703.07 (a), (b), (c), and (d).

Assessment category 4A is reserved for cases where a waterbody is impaired or threatened for one or more designated uses but does not require the development of a TMDL because a TMDL has been completed

Assessment Unit Name	Assessment Unit ID	Parameter Name	Primary Town	2012	2014
NHRIV600030709-01	LAMPREY RIVER	Oxygen, Dissolved	Epping	4A-M	3-ND

The Lamprey River (NHRIV600030709-01) was listed as impaired in 2004 due to low dissolved oxygen for aquatic life use support. There is currently no data for this AUID. The only data for this AUID is from 1998, that is, before the Lamprey River TMDL approved by EPA on 1/30/2001 and subsequent Epping WWTF upgrades and that data meets the DO criteria.

The TMDL recommended advanced limits at the Epping WWTP (2.7 upstream of NHRIV600030709-01). The new advanced wastewater treatment plant in Epping went on line in April, 2002. The AUID to which the Epping WWTF discharges (NHRIV600030703-18) is immediately upstream of (NHRIV600030709-01), the DO there has been improving since 2002, fully supports the dissolved oxygen criteria (concentration and percent saturation), and continues to be sampled.

The AUID downstream of NHRIV600030709-01 is NHRIV600030709-07. That AUID fully supports the dissolved oxygen saturation criteria and while there is insufficient information for dissolved oxygen concentration, none of the existing sample falls below the dissolved oxygen concentration.

There is no reason to maintain the Lamprey River (NHRIV600030709-01) as impaired for low dissolved oxygen.

The 4A impairment of the Lamprey River (NHRIV600030709-01) for Aquatic Life Use Support due to low dissolved oxygen has been removed. The Lamprey River has been placed in Category 3 (No Data).
