Home Water Efficiency: Planting Low Maintenance Lawns and Landscapes

Enjoy the beauty of lawns and gardens with less work and lower water bills. Having a beautiful landscape brings us much joy, but the financial and environmental costs of watering landscapes can be hefty, and maintenance can be tedious. By planting native plants and grasses adapted to our environment and sticking to a few simple guidelines, you can achieve a beautiful landscape that requires less work and less water, leaving more time for swinging in the hammock and listening to the birds.

Time it right.

- ✓ To prevent weed infestation and to promote a strong root system, the best time to plant grass seed in New Hampshire is August through September. Use a drought tolerant mix with at least 50% fine leaved fescues. Once established, a lawn of fine leaved fescues requires no watering. For more information, visit the [University of New Hampshire \(UNH\) Cooperative Extension](#) website.
- ✓ Balled-and-burlapped trees and shrubs should be planted in the early spring, prior to buds popping.
- ✓ Container-grown trees and shrubs should be planted in the summer and fall, while soils are still warm. From central New Hampshire and south, planting should occur no later than October 1.

The secret to success lies in the soil.

- ✓ Give your lawns and plants the best start possible. Underlay areas with at least six inches of loam. Without adequate topsoil for grass or plants, it doesn't really matter what you plant – the vegetation will require excessive watering and fertilization.
- ✓ Send a soil sample to the UNH Cooperative Extension to determine whether any soil nutrient amendments are needed. Fertilization is often not necessary, but if it is determined to be required, look for a natural organic or slow-release fertilizer.
- ✓ Amend soils with compost to improve aeration and water retention and to promote fertility. Prepare new vegetable and flower gardens or new areas to be seeded for a lawn by tilling one to three inches of compost into six to 12 inches of top soil. Existing lawns can be top dressed with one-quarter to one-half inch of compost each spring or fall.
- ✓ Compost may be purchased locally or created in your own backyard. To learn the basics about composting at

home, see NHDES' flyer on composting by searching for "composting" on the NHDES website at www.des.nh.gov. To learn a more comprehensive approach to backyard composting, go to Los Angeles County's [Smart Gardening](#) webpage.

Love your natives.

- ✓ Plant natives. Native vegetation is adapted to the northeast climate and requires little or no watering once established. To access extensive guidance related to native landscape design and maintenance, go to the UNH Cooperative Extension's [Home, Yard & Garden](#) webpage.
- ✓ Purchase native tree and shrub saplings grown right in New Hampshire from the [N.H. State Forest Nursery](#). Also, check with your local [county conservation district](#) to find out when your county holds its annual tree, shrub and bulb sales.
- ✓ Minimize lawn areas to only those areas you actually use for play or sitting and replace with native vegetation, wildflower meadows, or some type of groundcover. If you still would like to be able to walk through these areas, think about planting a ground cover that can withstand some foot traffic.

Mulch

Mulch eradicates weeds and therefore eliminates competition for available water and nutrients, minimizes evaporation, and adds nutrients to the soil during decomposition. For more tips on mulching, go to the U.S. Department of Agriculture Natural Resources Conservation Service's [Backyard Conservation](#) webpage.

- ✓ Mulch tree and shrub beds once per year with three inches to four inches of shredded wood, leaves, bark, or compost. Avoid using peat moss as a mulch. Though an excellent moisture-retentive soil amendment, its very high water-holding qualities result in pulling water from the soil beneath it.
- ✓ Avoid using non-porous plastic, gravel, marble chips and stones as mulch. In sunny locations, these materials act as heat sinks, drying the soil beneath. Restrict these items to walkways.
- ✓ Mulch vegetable gardens and flowers with compost or grass clippings.
- ✓ Leave clippings on the lawn after mowing.
