

# **New Hampshire Groundwater Level Monitoring**

## **April 2022**

**New Hampshire Geological Survey  
29 Hazen Drive, PO Box 95  
Concord, New Hampshire 03302-0095**

**May 6, 2022**

## GROUNDWATER CONDITIONS SUMMARY

New Hampshire state-wide average temperature and precipitation were slightly above normal in April 2022. State-wide average precipitation in New Hampshire for the month of April was 117% of normal<sup>1</sup>, according to data from the [Northeast Regional Climate Center](#) (NRCC). Most of southern and western New Hampshire received below normal to normal precipitation amounts, while most of northern New Hampshire received normal to above normal precipitation amounts. Percent of normal precipitation in New Hampshire determined from Quantitative Precipitation Estimates provided by National Weather Service's Advanced Hydrologic Prediction Service (AHPS) ranged from lows of 50 to 75% of normal in Newport and Claremont in western New Hampshire, to highs of 200 to 300% of normal in an area north of the White Mountains. Figure 1 shows the distribution of percent of normal April precipitation across New Hampshire from AHPS.

According to the [U.S. Drought Monitor map for New Hampshire](#) released on April 28, 2022, the extent of areas in New Hampshire designated as abnormally dry have contracted since last month. Moderate Drought (D1) through Exceptional Drought (D4) conditions are not present in New Hampshire. Abnormally Dry (D0) conditions now cover 2.5% of the State, a large decrease from the 35.9% of the State designated as abnormally dry at the end of March 2022. All of southern and central New Hampshire, and most of northern New Hampshire (97.5% of the state) are not designated as Abnormally Dry (D0). The areas designated as Abnormally Dry (D0) includes the northern limit of Coos County along the Canadian border and an area in northwestern Grafton County along the Vermont border. Figure 2 shows the locations and intensity of current classified drought conditions in New Hampshire.

Figures 1 and 2 show the monthly status of groundwater levels for both bedrock and overburden wells in the New Hampshire Geological Survey's Groundwater Level Monitoring Network (GWLMN). The GWLMN currently includes 11 bedrock and 19 overburden observation wells, all of which are measured monthly by hand near the end of each month. Bedrock wells are installed into bedrock and overburden wells are installed in the unconsolidated materials above bedrock. Using the monthly hand measurements, monthly medians and percentile statistics are calculated. Only wells with a period of record (POR) of 10 years or more for all months of the year are placed within statistical categories of: low, below normal, normal, above normal, and high (symbols dark red through blue, corresponding to <10, 10-25, 25-75, 75-90, and >90 percentile classes, respectively). The current monthly readings are summarized in Figures 1 and 2, and in Table 1 for all 30 wells in the network. The current depth to groundwater for each well along with the annual hydrographs showing the monthly statistical analysis are shown in the following figures. Additional plots showing the prior 24-months of groundwater measurements along with the "normal range" of the 25<sup>th</sup> to 75<sup>th</sup> percentile is shown for each well with POR > 10 years.

---

<sup>1</sup> Based on the most recent 30-year normal period, currently 1991 – 2020.

The April 2022 monthly well measurements show groundwater levels vary across the State from low to high levels, as indicated in Table 1. High (>90<sup>th</sup> Percentile) groundwater levels were recorded in the deep bedrock wells in Concord and Stewartstown. Above Normal (75<sup>th</sup> to 90<sup>th</sup> Percentile) groundwater levels were recorded in the overburden wells in Greenfield and Nashua. Below Normal (10<sup>th</sup> to 25<sup>th</sup> Percentile) levels were recorded in the two overburden wells in Newport, the bedrock well in Hooksett, and the shallow bedrock well in Kingston. Low (>10<sup>th</sup> Percentile) groundwater level was recorded in the overburden well located in Lancaster. The remaining wells are at normal (25<sup>th</sup> to 75<sup>th</sup> Percentile) levels for the month of April.

Of the five wells with < 10 years POR: both the shallow and deep bedrock wells (SOWB-02 and SOWB-01) in Rindge are near the highest levels recorded in April to date; the replacement overburden well in Concord (CVW-02.1) is above the median value for April; the overburden well in Barrington (BBW-53) is at the median level for April; and the bedrock well in Northwood (NWWB-01) is at the lowest level recorded in April to date.

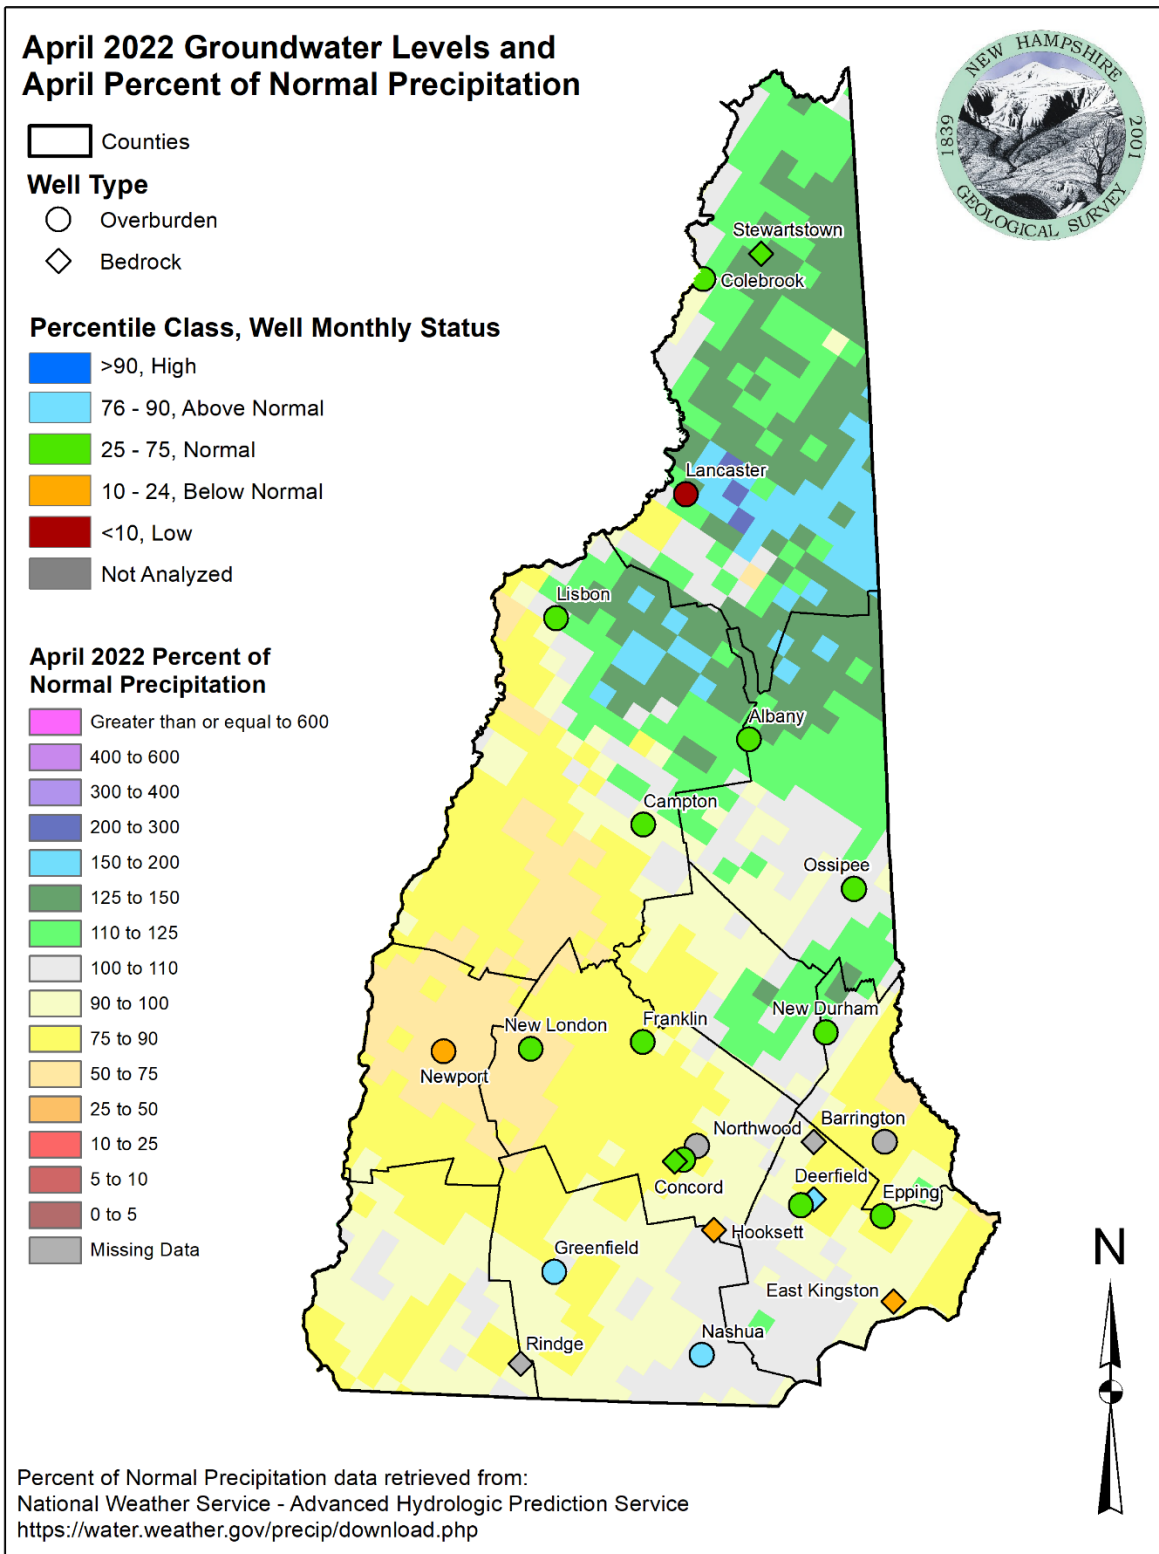

Groundwater level in Nashua continues to be at a high level for April. The groundwater level in the Nashua well (NAW-218) continues to be affected by dams on Pennichuck Brook related to a water supply reservoir. Planned replacement of NAW-218 with a new overburden well is expected to be completed by summer 2023.

#### **NOTES:**

For further information of the New Hampshire Geological Survey's groundwater level monitoring network, please visit the NHGS information page at the [USGS National Ground-Water Monitoring Network Portal](#) or [Groundwater - NH DES](#).

The annual and 2 year hydrograph plots and monthly statistics tables were created with R version 4.1.3 using a modified version of the Hydrologic AnalySis Package (HASP) provided by USGS. The HASP open-source code is available at the [USGS-R/HASP](#) page on Github.

If you are interested in receiving the monthly New Hampshire Groundwater Level Monitoring report by email, please contact [Michael.W.Howley@des.nh.gov](mailto:Michael.W.Howley@des.nh.gov) to be added to the email distribution list.

**Figure 1.** Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well’s period of record (POR) and percent normal precipitation map for April 2022 ([National Weather Service – Advanced Hydrologic Prediction Service](https://water.weather.gov/precip/download.php)).
