

New Hampshire Groundwater Level Monitoring

January 2022

**New Hampshire Geological Survey
29 Hazen Drive, PO Box 95
Concord, New Hampshire 03302-0095**

February 3, 2022

GROUNDWATER CONDITIONS SUMMARY

January 2022 was generally a cold and dry month in New Hampshire. State-wide precipitation in New Hampshire for the month of January was below normal, with Concord and Manchester measuring 53% and 83% of normal precipitation, respectively. Two small areas, one each in the Lakes region and the Seacoast region, received normal to above normal precipitation amounts while the rest of the State received below normal precipitation amounts. Corresponding below normal snow depth conditions exist in northern and western portions of the state. Percent of normal precipitation in New Hampshire determined from Quantitative Precipitation Estimates provided by the [National Weather Service Advanced Hydrologic Prediction Service](#) (AHPS) ranged from a low of 10 to 25% in western and far northern New Hampshire, to a high of 110 to 125% in a portion of the Lakes region. Figure 1 shows the distribution of percent of normal January precipitation across New Hampshire from AHPS.

According to the [National Drought Management](#) current conditions web page the extent of areas with drought conditions in New Hampshire has expanded since last month. All of the Monadnock, Merrimack Valley, and Seacoast regions, and parts of the Dartmouth-Lake Sunapee and Lakes regions (61% of the state) are not in a classified drought condition. Abnormally Dry (D0) conditions have been expanded to include 36% of the state, which represents a large increase from the previously designated 9% of the state as Abnormally Dry (D0). Moderate Drought (D1) conditions persist in 3.3% of the state, unchanged from last month. All of the area designated as Moderate Drought (D1) are located within Coos County. The extent of areas of Abnormally Dry (D0) and Moderate Drought (D1) conditions combined cover 39.3% of the State of New Hampshire. Figure 2 shows the locations and intensity of classified drought conditions in New Hampshire.

Figures 1 and 2 show the monthly status of groundwater levels for both bedrock and overburden wells in the New Hampshire Geological Survey's groundwater monitoring network. The network currently includes 11 bedrock and 19 overburden observation wells, all of which are measured monthly by hand. Bedrock wells are installed into bedrock and overburden wells are installed in the unconsolidated materials above bedrock. Using the monthly hand readings, monthly averages and percentile statistics are calculated. Only wells with a period of record (POR) of 10 years or more for all months of the year are placed within statistical categories of low, below normal, normal, above normal, and high (symbols dark red through blue, corresponding to <10, 10-25, 25-75, 75-90, and >90 percentile classes, respectively). The current monthly readings and status are summarized in Figures 1 and 2, and in Table 1 for all 30 wells in the network and shown for each individual well along with the hydrographs for wells with POR>10, or annual comparisons for wells with POR<10.

In general, the January 2022 well measurements show groundwater levels in the southern and central parts of the state continue to be at normal to above normal levels. Groundwater levels in the White Mountains region are at below normal levels. Groundwater levels in the western and northern parts of

New Hampshire are at low levels, with record low levels for the month of January recorded in Newport and Lancaster, NH.

Of the five wells with <10yr POR, BBW-53 in Barrington is at the same level as in January 2021, and NWWB-01 in Northwood is below the January 2021 level. The two wells in Rindge (RGWB-01 and -02) and the replacement overburden well in Concord (CVW-02.1) are all above the January 2021 levels.

Groundwater levels in Nashua continue to be at or just below record-high levels for the POR that well for January. The level in the Nashua well (NAW-218) is being affected by dams on Pennichuck Brook related to a water supply reservoir. The Barnstead, NH well has been removed from the groundwater level monitoring network due to sale of the private property where the well was located.

Notes:

For further information of the New Hampshire Geological Survey's groundwater level monitoring network, please visit the NHGS information page at the [USGS National Ground-Water Monitoring Network Portal](#) or [Groundwater - NH DES](#).

The hydrograph plots and monthly statistics tables were created with R using a modified version of the Hydrologic AnalySis Package (HASP) provided by USGS. The HASP source code is available at the [USGS-R/HASP](#) page on Github.

If you are interested in receiving the monthly New Hampshire Groundwater Level Monitoring report by email, please contact Michael.W.Howley@des.nh.gov to be added to the email distribution list.

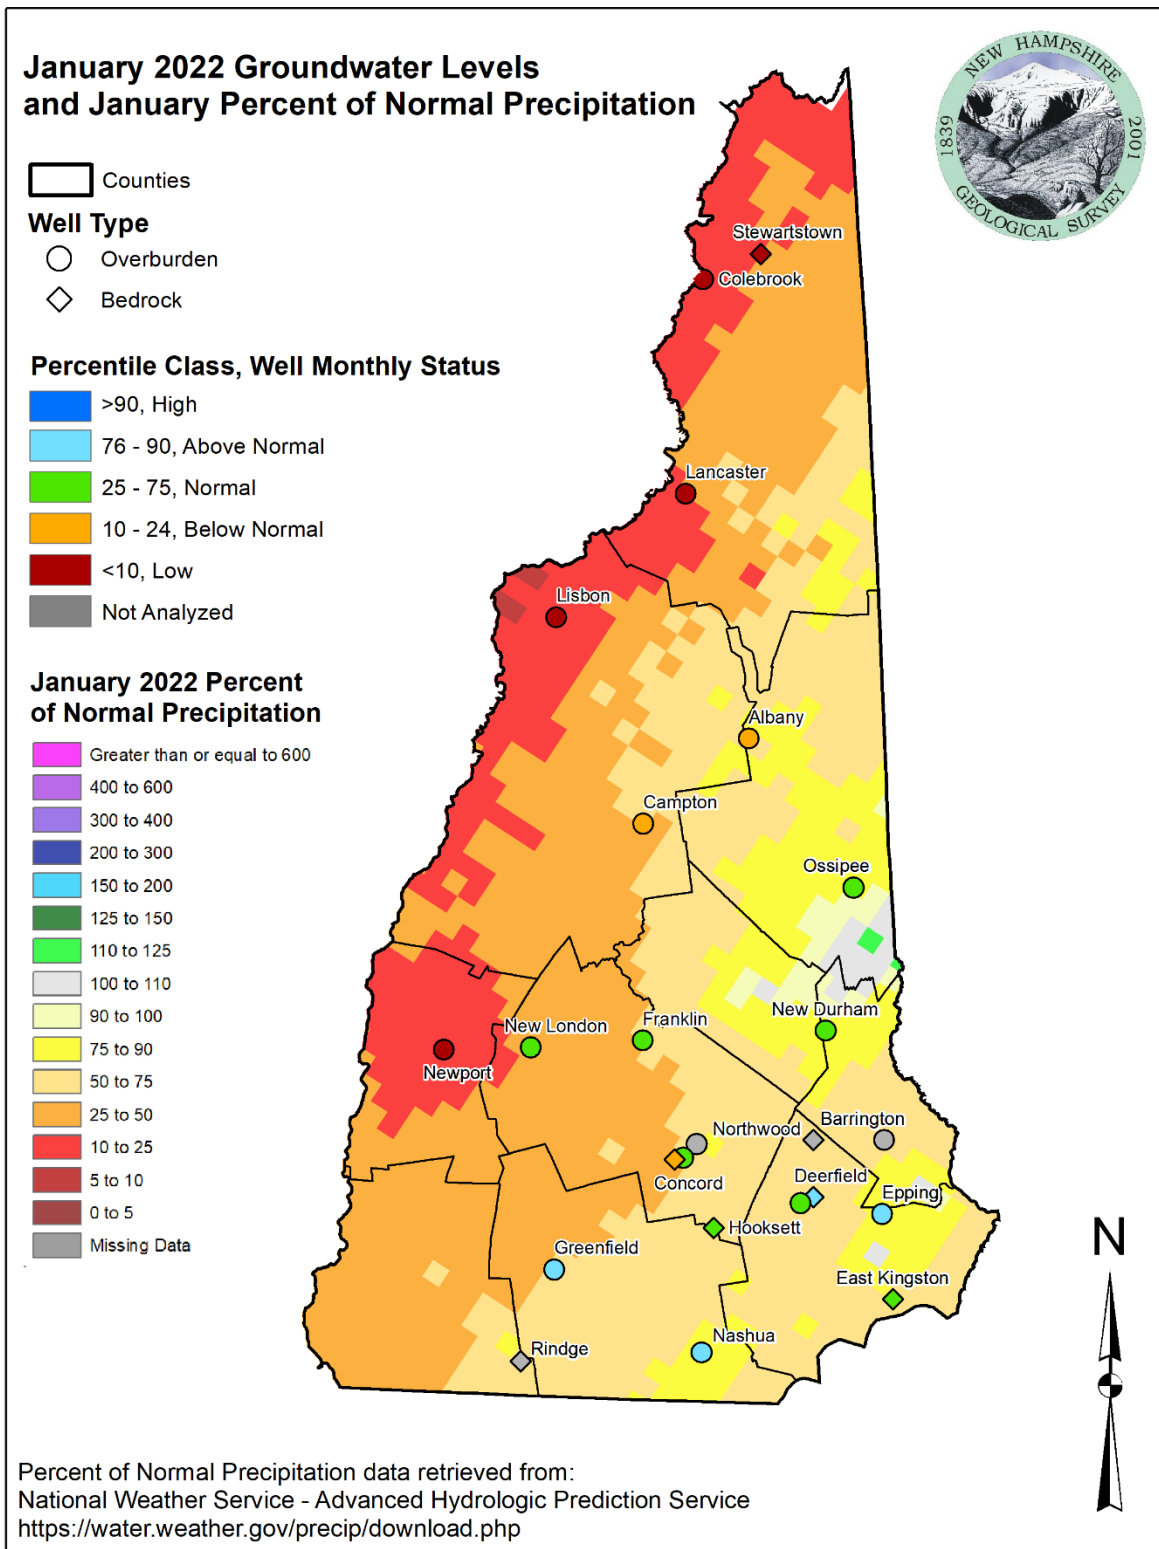

Figure 1. Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well's period of record (POR) and percent normal precipitation map for January 2022 ([National Weather Service – Advanced Hydrologic Prediction Service](https://water.weather.gov/precip/download.php)).

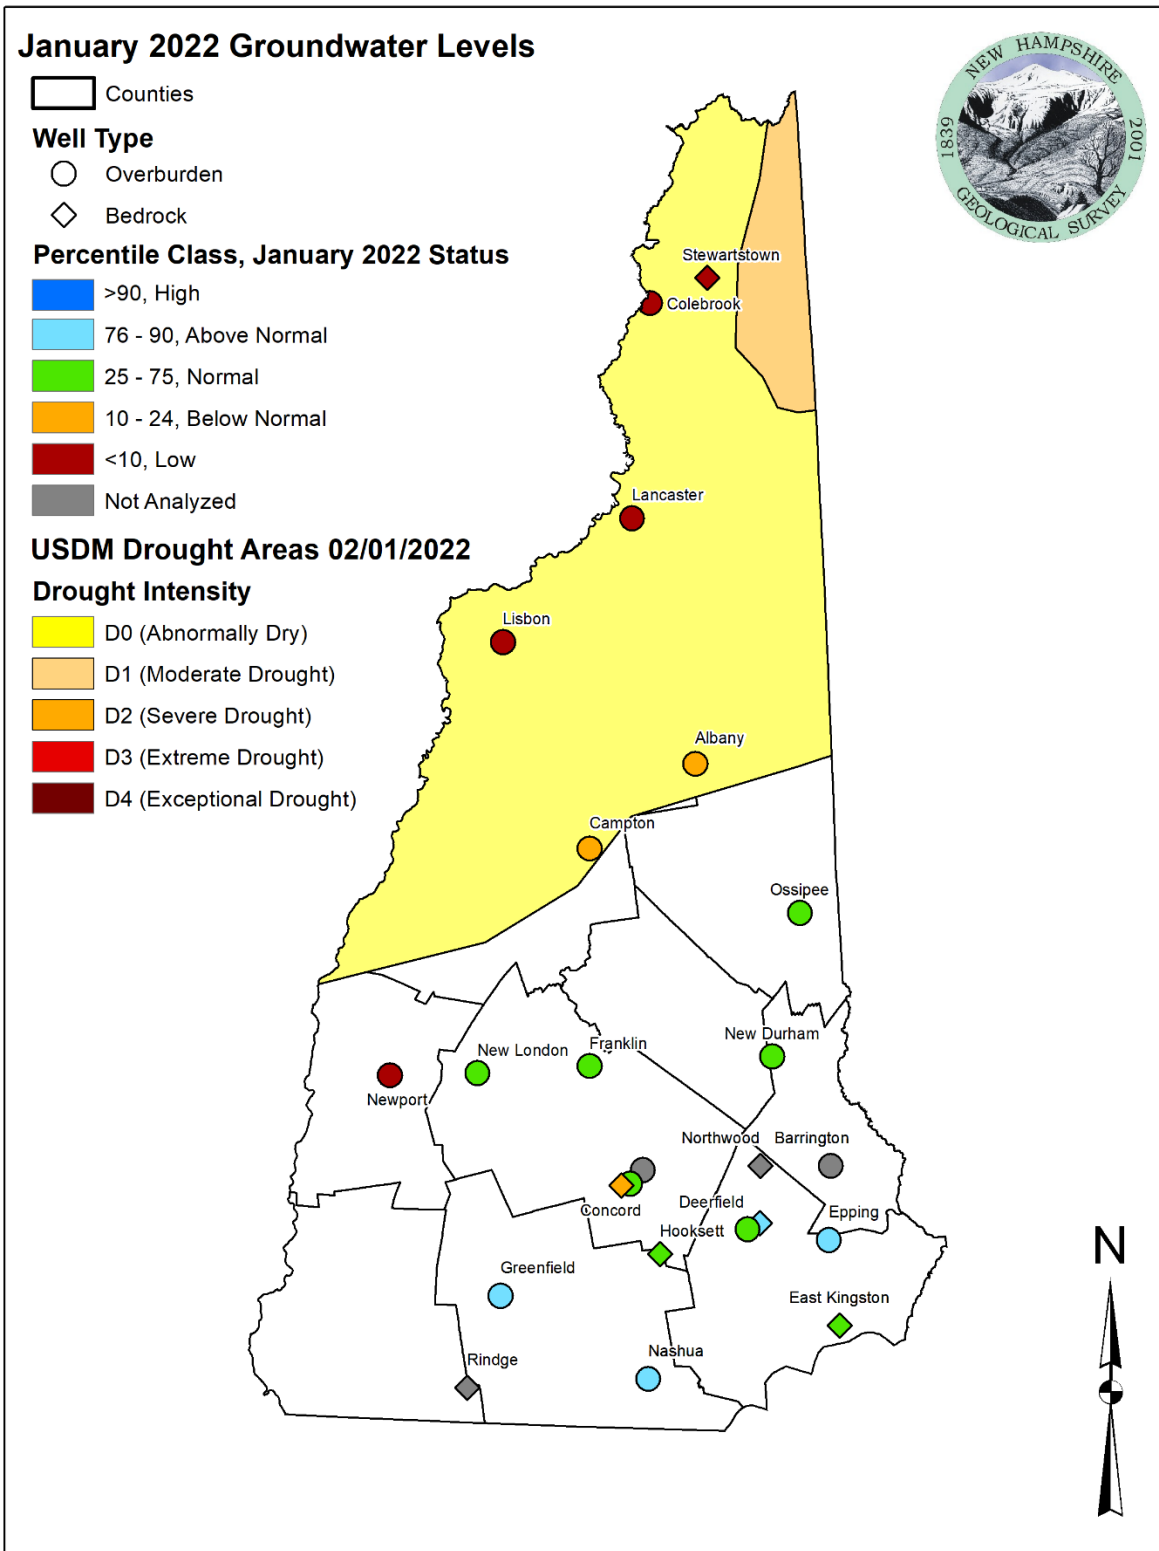

Figure 2. Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well’s period of record (POR) and drought areas according to data released by the [U.S. Drought Monitor](https://www.drought.gov/) on February 3, 2022.
