

# **New Hampshire Groundwater Level Monitoring**

## **March 2022**

**New Hampshire Geological Survey  
29 Hazen Drive, PO Box 95  
Concord, New Hampshire 03302-0095**

**April 7, 2022**

## GROUNDWATER CONDITIONS SUMMARY

March 2022 was a warmer and drier than normal month in New Hampshire. State-wide precipitation in New Hampshire for the month of March was 86% of normal<sup>1</sup>, according to the [Northeast Regional Climate Center](#). Most of southern New Hampshire received below normal to normal precipitation amounts, while most of northern New Hampshire received normal to above normal precipitation amounts. Below normal snow depth conditions persisted in most of the State during March, and snowfall for the month was well below normal. The above normal temperatures and below normal snowfall during the month resulted in an early spring melt for areas south of the White Mountains. Percent of normal precipitation in New Hampshire determined from Quantitative Precipitation Estimates provided by the [National Weather Service Advanced Hydrologic Prediction Service](#) (AHPS) ranged from a lows of 25 to 50% of normal in an area of western New Hampshire, to highs of 150 to 200% of normal in portions of the White Mountains region. Figure 1 shows the distribution of percent of normal March precipitation across New Hampshire from AHPS.

According to the [National Drought Management](#) current conditions web page, the extent of areas having designated drought conditions in New Hampshire have contracted since last month. All of the Monadnock, Merrimack Valley, and Seacoast regions, and parts of the Dartmouth-Lake Sunapee and Lakes regions (64.1% of the state) are not in a classified drought condition. Abnormally Dry (D0) conditions now include 35.9% of the State. Moderate Drought (D1) conditions are no longer present in New Hampshire, reduced from 3.3% of the State last month. The area designated as Abnormally Dry (D0) includes all of Coos County, most of Grafton County, and a portion of northern Carroll County. Figure 2 shows the locations and intensity of current classified drought conditions in New Hampshire.

Figures 1 and 2 show the monthly status of groundwater levels for both bedrock and overburden wells in the New Hampshire Geological Survey's Groundwater Level Monitoring Network (GWLMN). The GWLMN currently includes 11 bedrock and 19 overburden observation wells, all of which are measured monthly by hand. Bedrock wells are installed into bedrock and overburden wells are installed in the unconsolidated materials above bedrock. Using the monthly hand measurements, monthly averages and percentile statistics are calculated. Only wells with a period of record (POR) of 10 years or more for all months of the year are placed within statistical categories of: low, below normal, normal, above normal, and high (symbols dark red through blue, corresponding to <10, 10-25, 25-75, 75-90, and >90 percentile classes, respectively). The current monthly readings are summarized in Figures 1 and 2, and in Table 1 for all 30 wells in the network. The current depth to groundwater for each well along with the annual hydrographs

---

<sup>1</sup> Based on the most recent 30-year normal period, currently 1991 – 2020

for wells with  $POR > 10$ , or annual measurements with monthly median and monthly range of values for wells with  $POR < 10$  are shown in the following figures. Plots of the prior 24-months of groundwater measurements along with the “normal range” of 25<sup>th</sup> to 75<sup>th</sup> percentile are also shown in the following figures.

In general, the March 2022 well measurements show groundwater levels in most of the State are at normal to above normal levels. High groundwater levels were recorded in both overburden wells in Albany, the deep bedrock couplet member in Concord, and in the overburden well in Nashua. Record high groundwater level for the month of March was recorded in the shallow bedrock couplet member in Stewartstown. Groundwater level in the overburden well located in Lancaster is at a low level for the month of March, as shown in Table 1.

Of the five wells with  $< 10$ yr POR: the replacement overburden well in Concord (CVW-02.1) and the overburden well in Barrington (BBW-53) are above the median level for March; the bedrock well in Northwood is at the lowest level recorded for the month of March; RGWB-01 & RGWB-02 in Rindge are just below the highest levels recorded for the month of March.

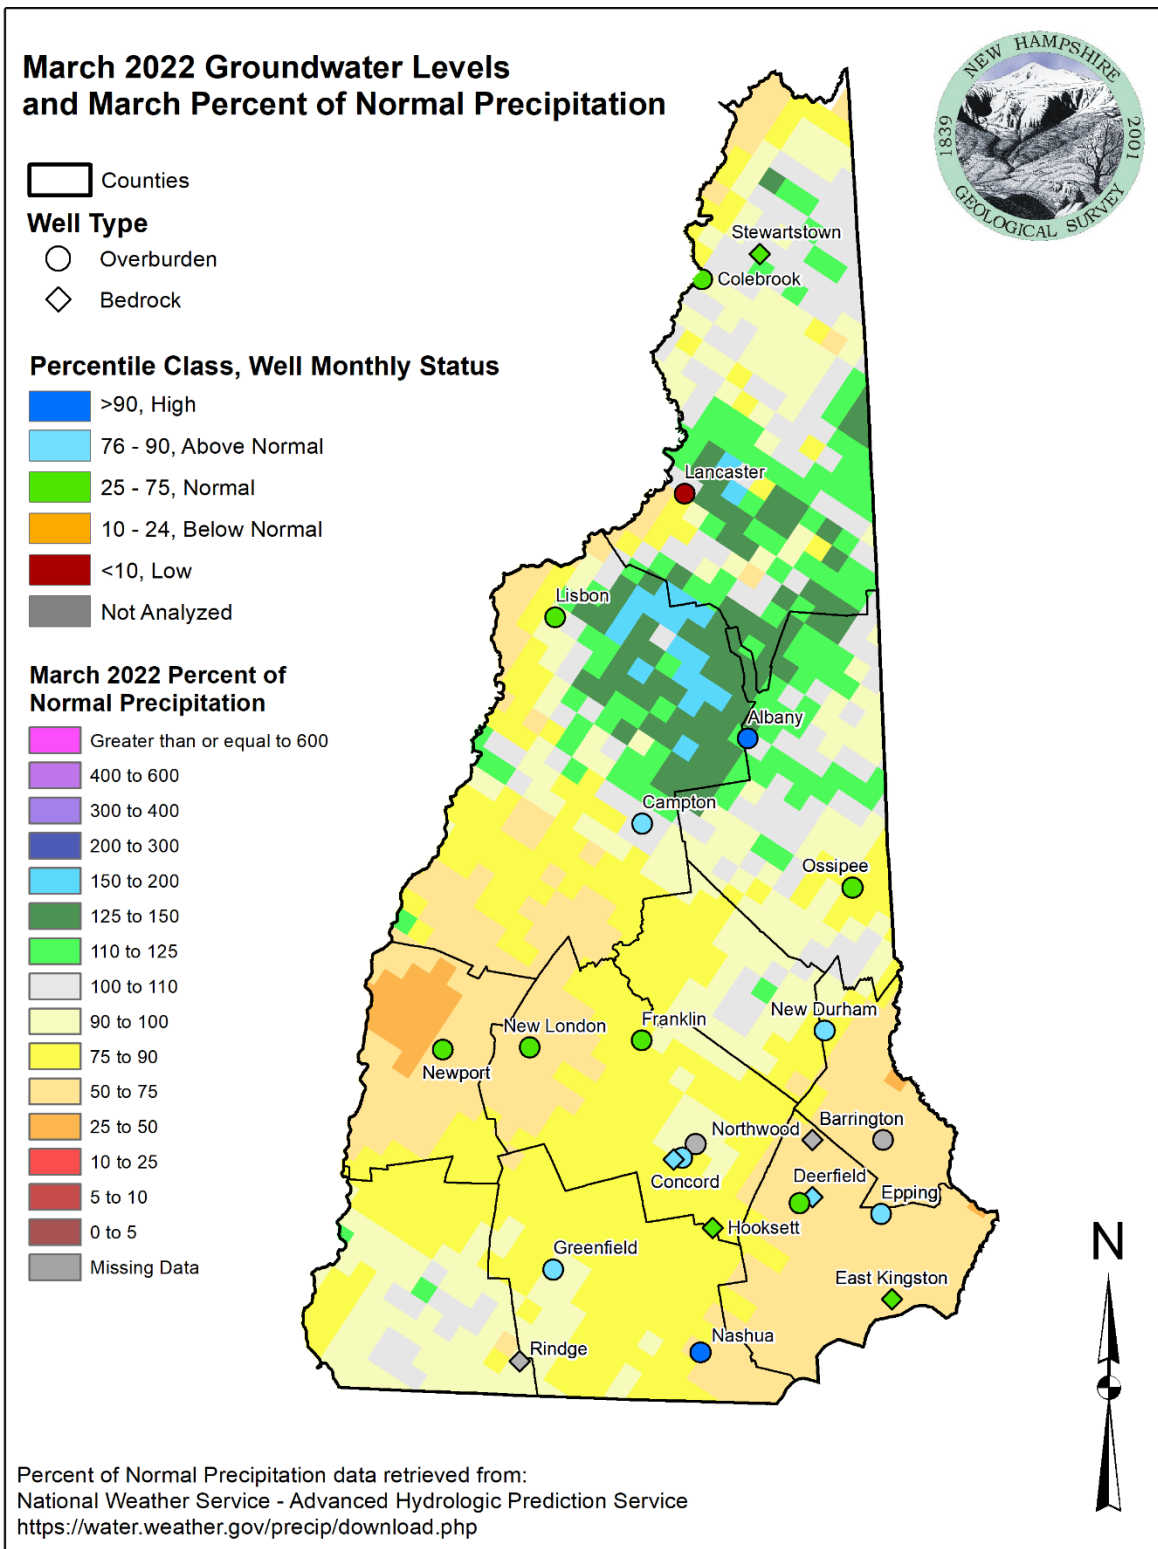

Groundwater levels in Nashua continue to be at or just below record-high levels for the POR for that well for March. The level in the Nashua well (NAW-218) continues to be affected by dams on Pennichuck Brook related to a water supply reservoir. Planned replacement of NAW-218 with a new overburden well is expected to be completed by summer 2022.

#### **NOTES:**

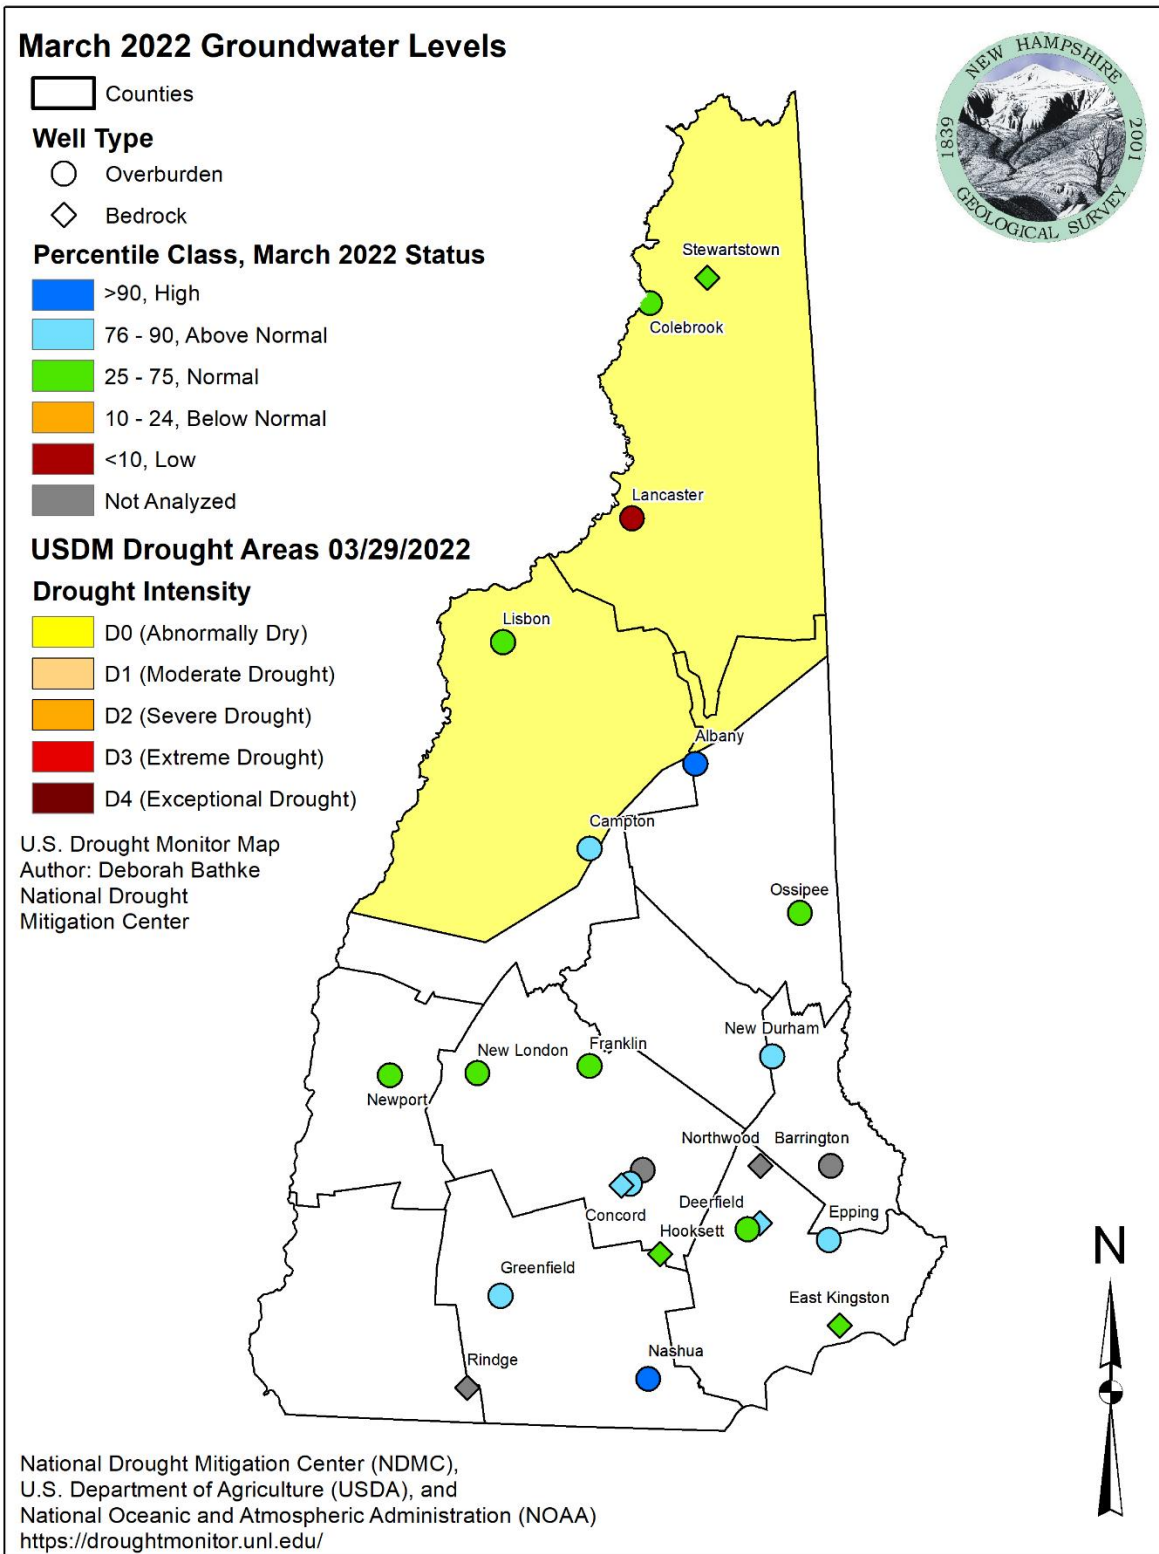

For further information of the New Hampshire Geological Survey’s groundwater level monitoring network, please visit the NHGS information page at the [USGS National Ground-Water Monitoring Network Portal](#) or [Groundwater - NH DES](#).

The hydrograph plots and monthly statistics tables were created with R version 4.1.2 using a modified version of the Hydrologic AnalySis Package (HASP) provided by USGS. The HASP open-source code is available at the [USGS-R/HASP](#) page on Github.

If you are interested in receiving the monthly New Hampshire Groundwater Level Monitoring report by email, please contact [Michael.W.Howley@des.nh.gov](mailto:Michael.W.Howley@des.nh.gov) to be added to the email distribution list.

**Figure 1.** Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well's period of record (POR) and percent normal precipitation map for March 2022 ([National Weather Service – Advanced Hydrologic Prediction Service](https://water.weather.gov/precip/download.php)).

**Figure 2.** Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well’s period of record (POR) and drought areas according to data released by the [U.S. Drought Monitor](https://droughtmonitor.unl.edu/) on March 29, 2022.
