

New Hampshire Groundwater Level Monitoring

March 2023

**New Hampshire Geological Survey
29 Hazen Drive, PO Box 95
Concord, New Hampshire 03302-0095**

April 6, 2023

NEW HAMPSHIRE GROUNDWATER CONDITIONS SUMMARY

Temperature and Precipitation. New Hampshire's monthly precipitation was slightly below normal¹ and monthly average temperature was above normal for March 2023. The State-wide average temperature was 2.4°F above normal for the month of March 2023, according to the [Northeast Regional Climate Center](#) (NRCC). The distribution of average departure from normal temperature according to the ACIS Climate Maps provided by the [High Plains Regional Climate Center](#) (HPCC) ranged from +1°F to +4°F for most of the State, with the White Mountains and North Country having the largest temperature departure from normal. The above normal temperature departure recorded in New Hampshire in March 2023 continued the trend of above normal monthly average temperature observed since October of 2022.

The State-wide mean precipitation for the month of March 2023 was 82% of normal, according to the Quantitative Precipitation Estimates (QPE) provided by the [National Weather Service Advanced Hydrologic Prediction Service](#) (AHPS). Most of New Hampshire received between 75% and 110% of normal precipitation amounts in March 2023. The exceptions were in portions of Sullivan, Strafford, Coos, western Grafton, and western Merrimack Counties, which received 50% to 75% of normal precipitation, and in portions of Cheshire, Hillsborough, eastern Grafton, and eastern Merrimack Counties which both received 110% to greater than 125% of normal precipitation. Percent of normal March precipitation State-wide in New Hampshire reported by QPE from AHPS ranged from a low of 41% of normal precipitation in far northern Coos County to a high of 137% of normal in a small area in the western White Mountains region. The State-wide mean \pm std. dev. percent normal monthly precipitation in February 2023 was 82% \pm 17%. Figure 1 shows the distribution of March 2023 percent of normal monthly precipitation received across New Hampshire as reported by the QPE from AHPS.

Snow Depth. Modeled snow depth in New Hampshire peaked on or about March 15, 2023, when snow depth ranged from 4 to 8 inches in southeastern New Hampshire to 50 to 75+ inches of snow depth in the White Mountains region, according to maps from the National Snow Analyses from the [National Weather Service National Operational Hydrologic Remote Sensing Center Interactive Snow Information](#) page. By the end of March 2023, snow depth had decreased across the State to be 0 inches in southern New Hampshire and the Seacoast Region, while the White Mountains Region retained more than 50 inches of snow depth in some places. Total seasonal snow accumulation in New Hampshire through April 5, 2023 ranged from approximately 24 to 36 inches in the Seacoast Region, to greater than 180 inches in the northern White Mountains Region.

Drought. According to the most recent [U.S. Drought Monitor map for New Hampshire](#) released on March 28, 2023, no part of the State of New Hampshire is currently designated as Abnormally Dry (D0) or greater conditions. Figure 2 shows the locations and intensity of current classified drought conditions in New Hampshire.

Groundwater Levels. Figures 1 and 2 show the monthly status of the most recent groundwater levels recorded for both bedrock and overburden wells in the New Hampshire Geological Survey's Groundwater Level Monitoring Network (GWLNMN). The GWLMN currently includes 11 bedrock and 22 overburden observation wells, all of which are measured monthly by hand near the end of each month. Hourly data loggers are currently installed in 23 of the 33 wells. Bedrock wells are installed into bedrock and overburden wells are installed in the unconsolidated materials above bedrock.

¹ Temperature and Precipitation departures are based on the most recent 30-year climate normal period, currently 1991 – 2020.

Where well “couplets” were installed in the same aquifer as paired wells at one monitoring site or in one town with the screened interval of the well open in different depth intervals, the wells are referred to as the “shallow” and “deep” overburden or bedrock well.

Using all monthly hand measurements and daily median levels from the data loggers (if installed), monthly median groundwater levels are calculated. The monthly medians are then used to calculate monthly statistics for each monitoring well. Only wells with a period of record (POR) of 10 years or more for the current month are placed within statistical categories of: low, much below normal, below normal, normal, above normal, much above normal, and high (symbols bright red through dark blue, corresponding to: below lowest monthly median; <10th; 10th-25th; 25th-75th; 75th-90th; >90th Percentiles; and above highest monthly median, respectively).

The status of the most recent groundwater level measurement for each well are summarized in Figures 1 and 2, and in Tables 1 and 2. The 12-month hydrographs of groundwater levels with statistical categories, a table reporting POR monthly statistics, and plots showing the prior 36-months of groundwater levels along with the “normal range” of the 25th to 75th percentile are shown for each well with POR > 10 years for the current month. The 12- and 36-month hydrographs in the figures also display either daily median levels calculated from the hourly logger data, if available, and/or the monthly hand measurement.

The most recent groundwater level measurements, recorded between March 21 and 31, 2023, show the monthly status (percentile class) of the most recent groundwater levels vary across the State of New Hampshire from Much Below Normal (<10th Percentile) to High (above highest monthly median) levels, as indicated in Tables 1 and 2.

- Much Below Normal (<10th Percentile) groundwater level was recorded in 1 well: the overburden well in Lancaster.
- Below Normal (10th to 25th Percentile) groundwater levels were recorded in 4 wells: the overburden well in Lisbon, and the bedrock well in Northwood, the shallow bedrock well in Stewartstown, and the deep bedrock well in East Kingston.
- Normal (25th to 75th Percentile) groundwater levels were recorded in 15 wells: both overburden wells in Albany, the overburden wells in Campton, Deerfield, Franklin, Greenfield, New Durham, and Ossipee, the deep overburden well in Concord, both overburden wells in Newport, the bedrock well in Deerfield, the shallow bedrock well in East Kingston, and both bedrock wells in Rindge.
- Above Normal (75th to 90th Percentile) groundwater levels were recorded in 5 wells: the shallow overburden well in Concord, the overburden wells in Epping and New London, the bedrock well in Hooksett, and the deep bedrock well in Concord.
- Much Above Normal (> 90th Percentile) groundwater levels were recorded in 1 well: the overburden well in Nashua.
- High (Above Highest Monthly Median) groundwater level was recorded in 1 well: the shallow bedrock well in Concord.
- For the 1 well with POR less than 10 years and greater than 1 year for March: the most recent measurements in the overburden well in Barrington (BBW-53) is near the highest level recorded in March.

NOTES:

For further information of the New Hampshire Geological Survey's groundwater level monitoring network, please visit the NHGS information page at the [USGS National Ground-Water Monitoring Network Portal](#) or [Groundwater - NH DES](#).

NHGS maintains a Web App for viewing groundwater data from the NH Groundwater Level Monitoring Network. The Web App is available through the NHDES Geodata Portal at <https://nhdes.maps.arcgis.com> or directly at <https://nhdes.maps.arcgis.com/apps/webappviewer/index.html?id=521022e32a1540c2b281a071aa5421b7>

The 12-month hydrographs, monthly statistics tables, and 3-year hydrographs were created with R version 4.2.2 using a heavily modified version of the Hydrologic AnalySis Package (HASP) provided by USGS. The HASP open-source code is available at the [USGS-R/HASP](#) page on Github. For more information about the statistical methods used to calculate percentiles, POR determinations, and other algorithm design decisions, see the [NGWMN Statistics Methods](#) page. NHGS has attempted to conform to the statistical methods specified by the NGWMN whenever possible.

The historic groundwater level record from CVW-02 measured between 1966 and December of 2017 is now being associated with the nearby replacement well CVW-02R. CVW-02R was installed in January 2017 outside the secure perimeter of Concord Airport due to security concerns. A Pearson correlation coefficient of $r = 0.986$ was calculated for the $n = 11$ overlapping monthly measurements, indicating a strong linear correlation between groundwater depth measured in the two wells. The mean offset between paired monthly measurements was determined to be less than 0.1 foot between the two sites.

If you are interested in receiving the monthly New Hampshire Groundwater Level Monitoring report by email, please contact Michael.W.Howley@des.nh.gov to be added to the email distribution list.

Table created: 2023-04-03

Figures and table created with R version 4.2.2 using a heavily modified version of the Hydrologic AnalySis Package (HASp) open source code by USGS

RGWB-01: Rindge, NH Bedrock Well, Deep Couplet Member
Groundwater Levels and Statistics for Past 3 Years

RGWB-02: Rindge, NH Bedrock Well, Shallow Couplet Member
Annual Hydrograph with Historical Median and Percentile Classes

New Hampshire Geological Survey

Period of Record Monthly Statistics for RGWB-02

Depth to water, feet below land surface

Most recent depth to water in RGWB-02: 16.41 feet on 2023-03-25

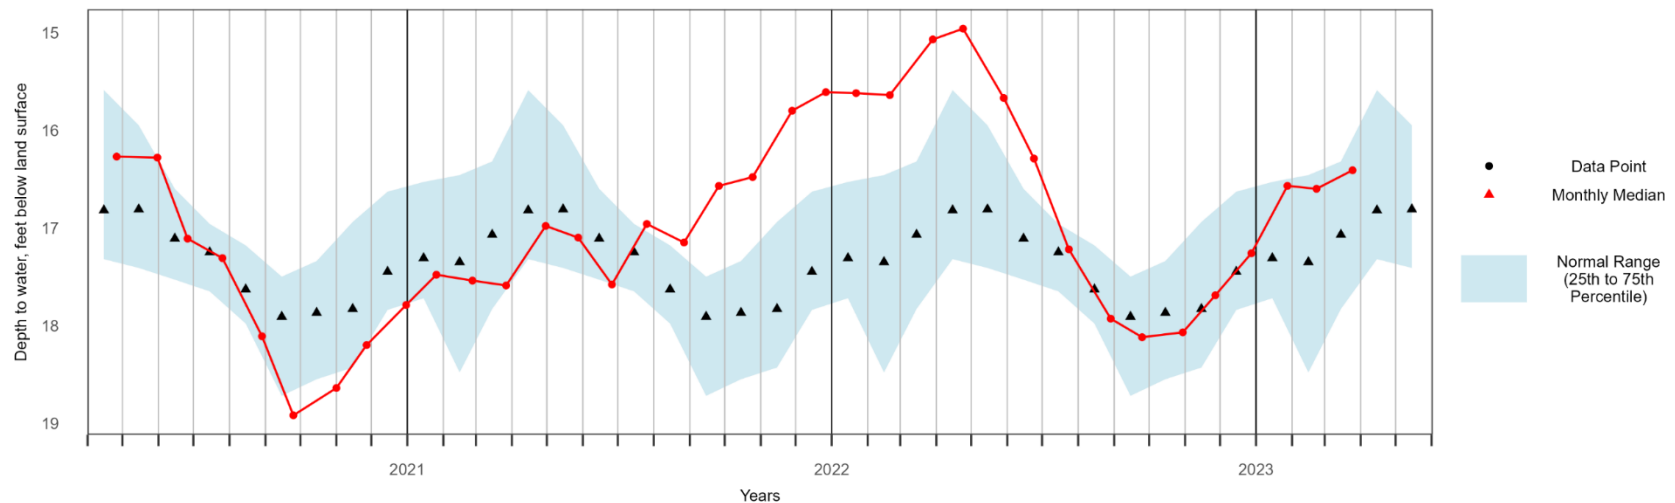

Month	Lowest Median	10th Percentile	25th Percentile	50th Percentile	75th Percentile	90th Percentile	Highest Median	POR
Jan	19.58	19.38	17.72	17.31	16.53	15.14	14.67	14
Feb	19.55	19.55	18.48	17.35	16.46	15.64	15.64	9
