# New Hampshire Groundwater Level Monitoring August 2022 Mid-Month

New Hampshire Geological Survey 29 Hazen Drive, PO Box 95 Concord, New Hampshire 03302-0095

August 16, 2022

#### **GROUNDWATER CONDITIONS SUMMARY**

New Hampshire state-wide average precipitation for the period of August 1-15, 2022 was 54% of normal<sup>1</sup>, according to the Quantitative Precipitation Estimates provided by the National Weather Service Advanced Hydrologic Prediction Service (AHPS). Most of New Hampshire received below normal precipitation amounts, with the exception of a west-southwest to east-northeast line extending from Claremont to Wakefield which received above normal precipitation. Percent of normal precipitation state-wide in New Hampshire determined by AHPS ranged from a low of 10% of normal precipitation to a high of 150%. Figure 1 shows the distribution of percent of normal August 1-15 precipitation received across New Hampshire determined by AHPS.

According to the most recent <u>U.S. Drought Monitor map for New Hampshire</u> released on August 11, 2022, the extent of areas in New Hampshire designated as Abnormally Dry (D0), Moderate Drought (D1), and Severe Drought (D2) combined have contracted slightly since July 26, 2022. The cumulative percent area of New Hampshire designated as either Abnormally Dry (D0) through Severe Drought (D2) conditions is 99.1% of the State, a small decrease in area from the 100% of the State designated as D0 through D2 at the end of July 2022. 13.3% of the State of New Hampshire is currently designated as Severe Drought (D2), all of which is in Strafford, Rockingham, Hillsborough, and Cheshire Counties., Moderate Drought (D1) conditions cover 26% of New Hampshire, a large decrease from late July. Most of the rest of New Hampshire is currently designated as Abnormally Dry (D0), except for the northern edge of Coos County along the Canadian border. Figure 2 shows the locations and intensity of current classified drought conditions in New Hampshire.

Figures 1 and 2 show the monthly status of the most recent groundwater level measurements for both bedrock and overburden wells in the New Hampshire Geological Survey's Groundwater Level Monitoring Network (GWLMN). The GWLMN currently includes 11 bedrock and 19 overburden observation wells, all of which are measured monthly by hand near the end of each month. Hourly data loggers are currently installed in 21 of the 30 wells. Bedrock wells are installed into bedrock and overburden wells are installed in the unconsolidated materials above bedrock. Using all monthly hand measurements and daily median levels from the data loggers (if installed), monthly median groundwater levels are calculated. The monthly medians are then used to calculate monthly statistics for each monitoring well. Only wells with a period of record (POR) of 10 years or more for the current month are placed within statistical categories of: low, much below normal, below normal, normal, above normal, much above normal, and high (symbols bright red through dark blue, corresponding to: below the lowest monthly median, <10, 10-25, 25-75, 75-90, >90, and above highest monthly median, respectively). The status of the most recent groundwater level measurement for each well are summarized in Figures 1 and 2, and in Table 1. The combined 12-month hydrographs of groundwater levels with statistical categories and a table reporting POR monthly statistics are shown for each well with POR > 10 years for the current month in the following figures. Additional plots showing the prior 24-months of groundwater levels

<sup>&</sup>lt;sup>1</sup> Based on the most recent 30-year normal period, currently 1991 – 2020.

along with the "normal range" of the 25<sup>th</sup> to 75<sup>th</sup> percentile for each well with POR > 10 years for the current month are also shown. The 12- and 24-month hydrographs in the following figures also display either daily median levels calculated from the hourly logger data, if available, and/or the monthly hand measurement.

The most recent groundwater level measurements recorded between August 9 and 12, 2022 show the monthly status (percentile class) of groundwater levels vary across the State from low to above normal levels, as indicated in Table 1. Only wells that were measured in the second week of August (23 of 30 wells) are included in the description below:

- Low (below lowest monthly median) groundwater levels were recorded 2 wells: the shallow overburden well in Newport, and the bedrock well in Northwood.
- Much Below Normal (less than 10<sup>th</sup> Percentile) groundwater levels were recorded in 4 wells: the overburden wells in Campton, Lancaster, Lisbon, and the deep overburden well in Newport.
- Below Normal (10<sup>th</sup> to 25<sup>th</sup> Percentile) groundwater levels were recorded in 6 wells: both overburden wells in Albany, the overburden well in New Durham, both bedrock wells in East Kingston, and the bedrock well in Hooksett.
- Normal (25<sup>th</sup> to 75<sup>th</sup> Percentile) groundwater levels were recorded in 10 wells: the shallow overburden well in Concord, the overburden wells in Deerfield, Epping, Franklin, Greenfield, New London, and Ossipee, both bedrock wells in Concord, and the bedrock well in Deerfield.
- Above Normal (75<sup>th</sup> to 90<sup>th</sup> Percentile) groundwater level was recorded in 1 well: the
  overburden well in Nashua. The groundwater level in the Nashua overburden well (NAW-218)
  continues to be affected by dams on Pennichuck Brook related to a water supply reservoir.

NHGS' Web App for viewing groundwater data from the NH Groundwater Level Monitoring Network is available through the NHDES Geodata Portal at <a href="https://nhdes.maps.arcgis.com">https://nhdes.maps.arcgis.com</a> or directly at <a href="https://bit.ly/3QbtJmY">https://bit.ly/3QbtJmY</a>

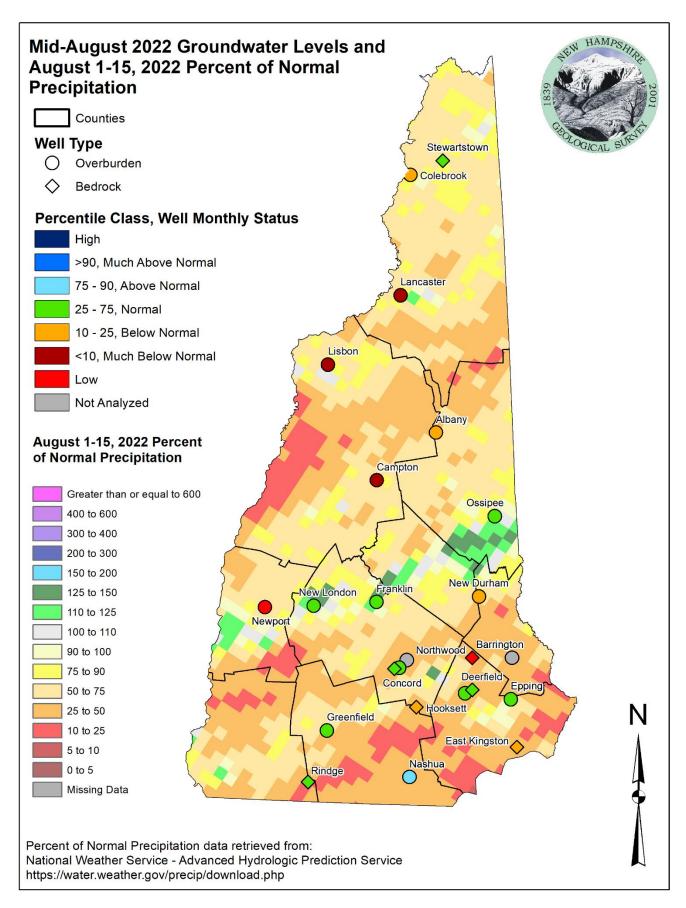

#### **NOTES:**

For further information of the New Hampshire Geological Survey's groundwater level monitoring network, please visit the NHGS information page at the <u>USGS National Ground-Water Monitoring</u> Network Portal or Groundwater - NH DES.

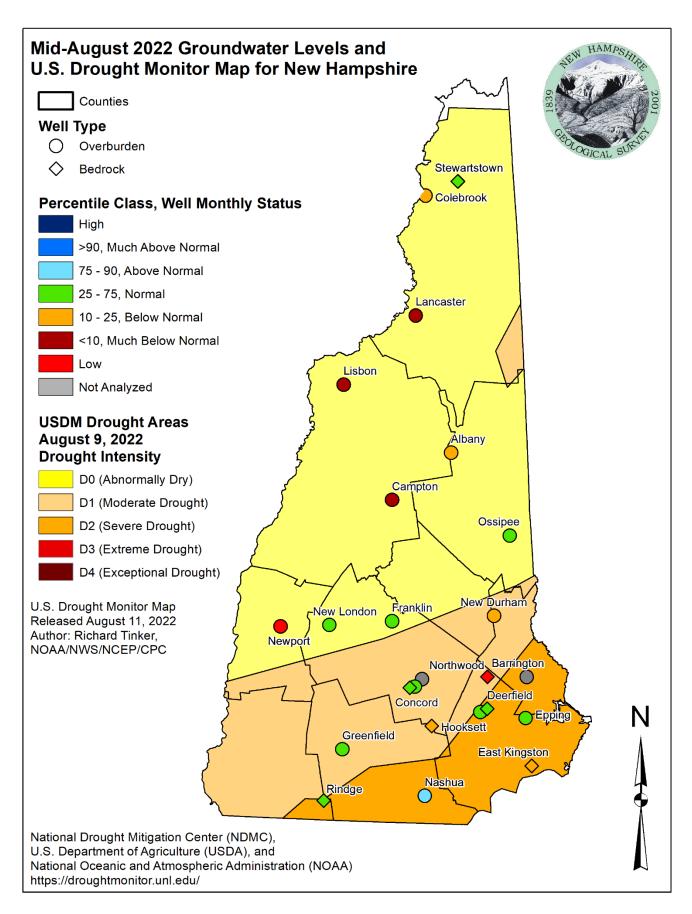

The 12- and 24-month hydrographs and monthly statistics tables were created with R version 4.1.3 using a heavily modified version of the Hydrologic AnalySis Package (HASP) provided by USGS. The HASP open-source code is available at the <u>USGS-R/HASP</u> page on Github.

For more information about the statistical methods used to calculate percentiles, POR determinations, and other algorithm design decisions, see the <u>NGWMN Statistics Methods</u> page. NHGS has attempted to conform to the statistical methods specified by the NGWMN whenever possible.

If you are interested in receiving the monthly New Hampshire Groundwater Level Monitoring report by email, please contact Michael.W.Howley@des.nh.gov to be added to the email distribution list.

**Figure 1.** Groundwater Monitoring Network map showing groundwater levels relative to statistical envelopes calculated over each well's period of record (POR) and percent normal precipitation map for August 1-15, 2022 (National Weather Service – Advanced Hydrologic Prediction Service).

**Figure 2.** Groundwater Monitoring Network map showing groundwater levels relative to statistical envelopes calculated over each well's period of record (POR) and drought areas according to data released by the <u>U.S. Drought Monitor</u> on August 11, 2022.

**Table 1.** Summary of groundwater levels sorted by well type.
