

# **New Hampshire Groundwater Level Monitoring**

## **November, 2021**

**New Hampshire Geological Survey  
29 Hazen Drive, PO Box 95  
Concord, New Hampshire 03302-0095**

**December 7, 2021**

## GROUNDWATER CONDITIONS SUMMARY

According to the [Northeast Regional Climate Center](#) (NRCC) at Cornell University, state-wide precipitation in New Hampshire for the month of November was 74% of normal. All of New Hampshire received below normal precipitation in November. Percent of normal precipitation in New Hampshire determined from Quantitative Precipitation Estimates provided by the [National Weather Service – Advanced Hydrologic Prediction Service](#) (AHPS) ranged from a low of 17.4% in western New Hampshire, to greater than 90% in the White Mountains region. Figure 1 shows the distribution of percent of normal November precipitation across New Hampshire from AHPS.

According to the [National Drought Management current conditions web page](#), the severity of drought conditions in New Hampshire have decreased slightly since last month. All of southern and central New Hampshire, and part of the White Mountains region (88% of the state) are not in a classified drought condition, unchanged from October. Abnormally Dry (D0) and Moderate Drought (D1) combined persist in 12% of the state, all of which is located within Coos County. The extent of area in New Hampshire classified as Severe Drought (D2) was eliminated in early November and replaced with Moderate Drought (D1). Figure 2 shows the locations and intensity of classified drought conditions in New Hampshire.

Figures 1 and 2 show the monthly status of groundwater levels for both bedrock and overburden wells in the New Hampshire Geological Survey's groundwater monitoring network. The network currently includes 11 bedrock and 20 overburden observation wells, all of which are measured monthly by hand. Bedrock wells are installed into bedrock and overburden wells are installed in the unconsolidated materials above bedrock. Using the monthly hand readings, monthly averages and percentile statistics are calculated. Only wells with a period of record (POR) of 10 years or more for all months of the year are placed within statistical categories of low, below normal, normal, above normal, and high (symbols dark red through blue, corresponding to <10, 10-25, 25-75, 75-90, and >90 percentile classes, respectively). The current monthly readings and status are summarized in Figures 1 and 2, and in Table 1 for all 31 wells in the network, and shown for each individual well along with the hydrographs for wells with POR>10, or annual comparisons for wells with POR<10.

In general, the November 2021 well measurements show groundwater levels in the southern and central parts of the state are normal to high. Groundwater levels in the three wells in Coos County are below normal to low. Groundwater levels in Barnstead and Nashua continue to be at or just below record-high levels for the POR for those wells for November. The level in the Barnstead well (BAW-10) is being affected by the presence of a beaver dam along the nearby Little River, and the level in the Nashua well (NAW-218) is being affected by dams on Pennichuck Brook related to a water supply reservoir. Of the five wells with <10yr POR, all are above November 2020's monthly groundwater level.

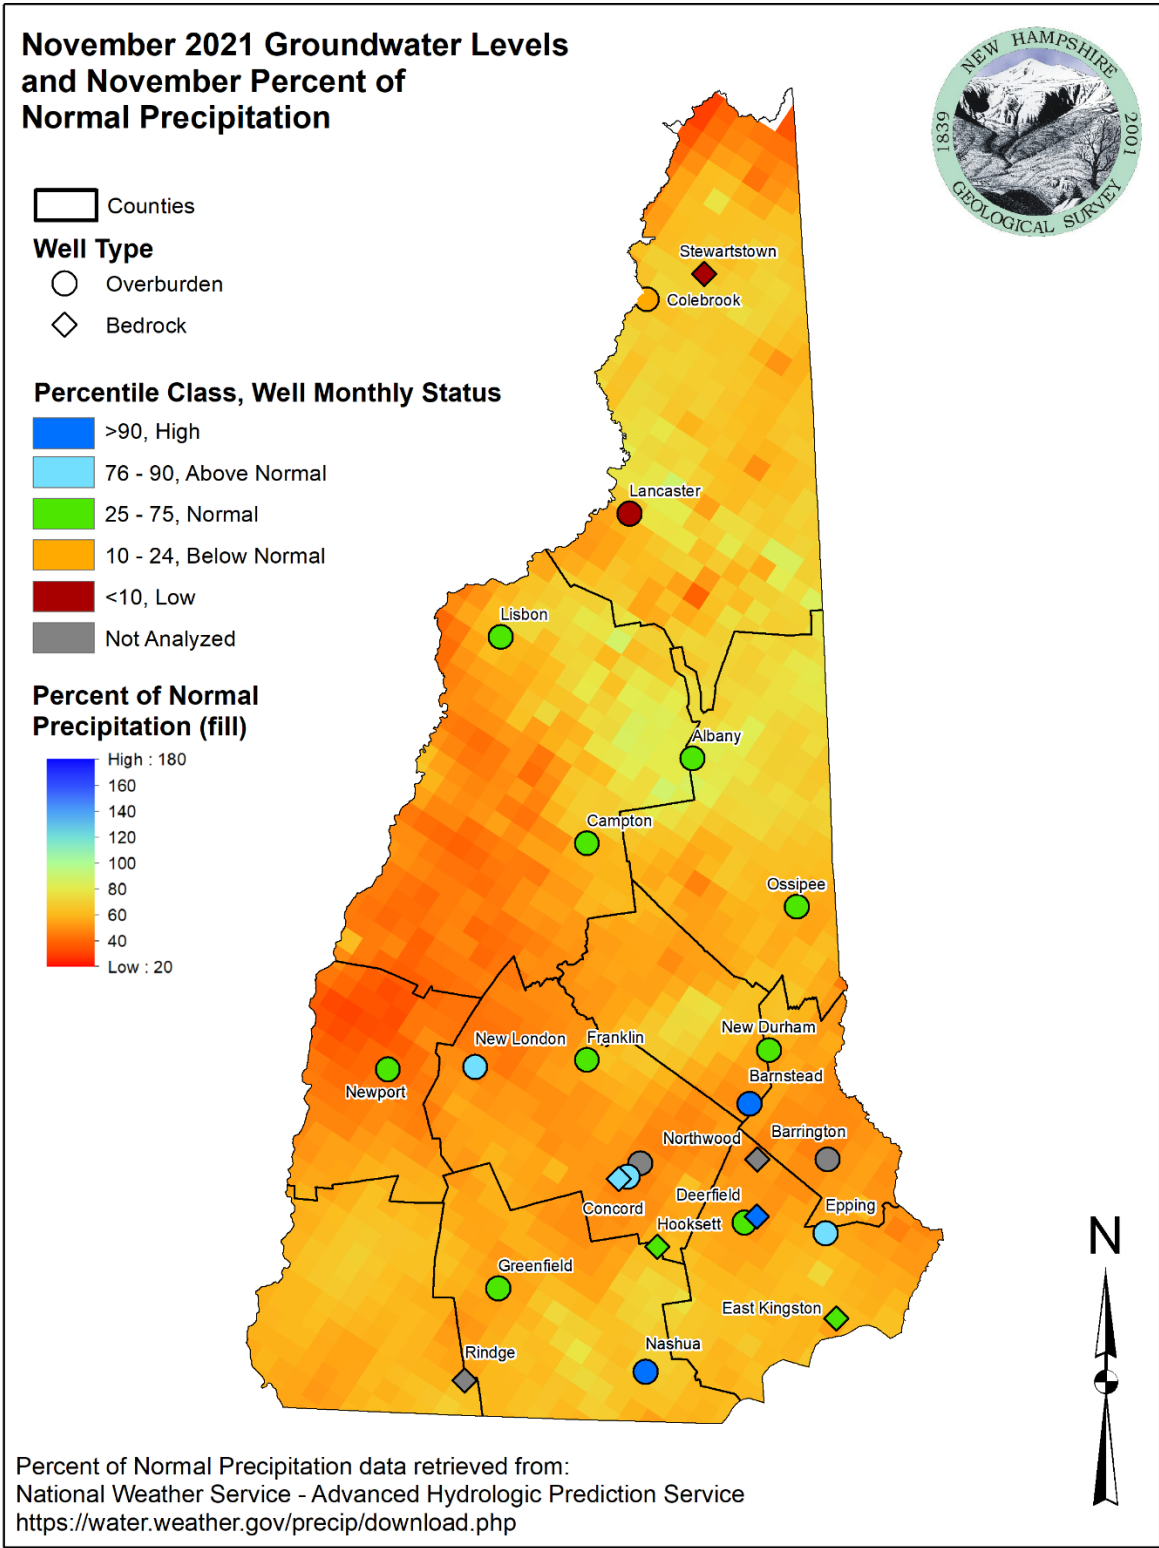

## Notes:

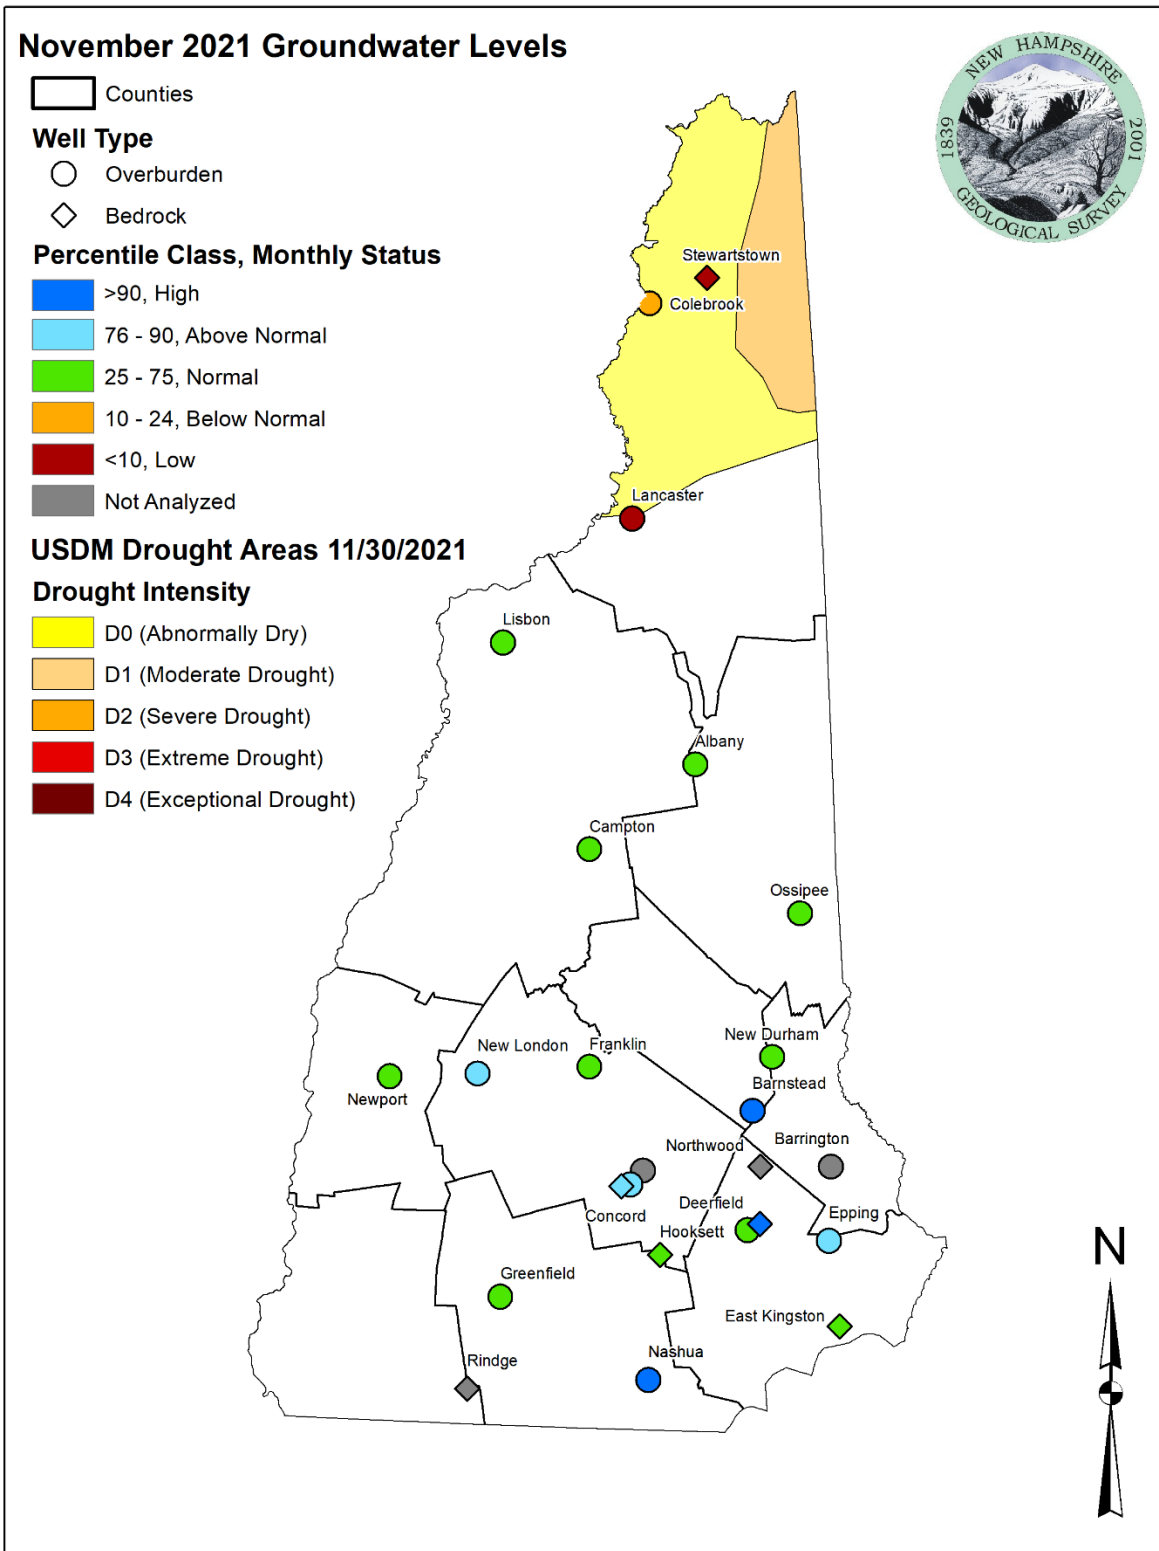

This month's Groundwater Level Monitoring Report contains a number of stylistic and content changes from past reports. The colors used to indicate the percentile classes representing the monthly status of each well have been changed to better align with the reporting style on the [USGS Groundwater Watch](#) website. Similarly, we include the Period of Record Monthly Statistics tables for each well with POR>10 and indicate where the current month measurement falls in that data. The hydrograph plots and POR statistics for each well are presented together on a single page. Simplified hydrographs for all wells with POR>10 are included at the end of this report. For wells that do not have full statistics calculated, the current year hydrograph is plotted along with the prior year's measurements.

For further information of the New Hampshire Geological Survey's groundwater level monitoring network, please visit the NHGS information page at the [USGS National Ground-Water Monitoring Network Portal](#) or [Groundwater - NH DES](#).

The hydrograph plots and monthly statistics tables were created with R using a modified version of the Hydrologic AnalySis Package (HASP) provided by USGS. The HASP source code is available at the [USGS-R/HASP](#) page on Github.

**Figure 1.** Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well’s period of record (POR) and percent normal precipitation map for November, 2021 ([National Weather Service – Advanced Hydrologic Prediction Service](https://water.weather.gov/precip/download.php)).

**Figure 2.** Groundwater Monitoring Network showing groundwater levels relative to statistical envelopes calculated over each well’s period of record (POR) and drought areas according to data released by the [U.S. Drought Monitor](#) on November 30, 2021.

**Table 1.** Summary of groundwater levels sorted by well type.
